Correct. I forgot to add that maybe PCs and MACs manufactures may charge
profit margins a lot more than necessary in those ol' days. They cannot
do it anymore because of competition. I think that prices could not be a
lot lower nowaday and how could "Atari" prices could be lower than
"others" ones, specialy with a so small market...

Bye,
/Pascal/

You need to both 'add' and 'update' the fonts, using the font
manager. IIRC, the manual doesn't cover this particularly well,
which is why I'm not telling you to rtm. But it is in there.

> recommend?

Well, under STinG I use Telstar:
http://www.stud.uni-hannover.de/~perot/cli-serv.dl-bay-e.html

Although under MiNT I use the supplied UNIX like telnet client.

> And is there anything more complex available to run over
> TCP/IP, such as SMB capability or an NFS client? The ST's got a copy of
> MiNT on it (it hasn't been used for years though) so could I do
> something like this with MiNT-net? Or is there some (free) software
> available for TOS?

There are NFS & SMB clients available for MiNT although if you with
to use these you will have to install MiNTNet rather than STiK.
Take a look at: ftp://ftp.funet.fi/pub/atari/mint/network

I don't know your ST setup, but if you only have a 1MB, FD only system
you may struggle to install MiNT, MiNTNet & NFS, Samba.

Hope this help.

>Do you mean that the filename you selected is not placed in the
>"Dial script :" filename field,

Exactly. I have 3 scripts in my dialer directory, one is copied as the
default dial.scr for my main ISP (Freeserve).

(I've also removed all the proxy settings from the default.cfg file and
placed them in the "environment" section of the respective dial scripts
(some of the ISPs don't have an http: proxy hence I had to do this to
prevent attempts to access the wrong server). I'm assuming that CAB is able
to pick up the necessary proxy from the dialer as naturally enough clicking
on "default addresses" from the "Proxys/Servers" menu clears any entries
that were there, picked up from the default.cfg.)

> or that the settings from that file do not take effect as you wish ?
>
>My further answers below assume the latter.

I understand this answer, but I don't get that far - well, OK, as I said it
takes several attempts before the dialer will load the new script.

>>This is a Falcon running MagiC 6 with Freedom, same problem with Freedom
>>disabled.
>

Understood. Perhaps this is just "one of those things", not Earth-shaking
but I'd like to see it working here nonetheless, and at least you've set my
mind to rest that it should work.

That's good, WHEN I CAN AFFORD TO BUY DISKS. During the last year that has been something I've not been able to do. I've been trying to use my old floppys, and out of some 500 I had, I've got maybe 200 left that didn't go bad on me.

1926. Re: Stik help

Newsgroup: comp.sys.atari.st
Date: 1999-04-30 00:00:00 UTC
From: claytone@aa.net
Message-ID: <7gbihqeic1@slave1.aa.net>
Source record: 79653

Hi Chris,

I have Stik working on my Falcon. It runs fine. I have a Supra 28.8 external modem (upgraded to 33.6 via flashrom), and am using plain TOS 4.04, and to help speed up screen redraws and the mouse I'm using Warp 9. I'm not using NVDI or Magic. I could email you my Stik dial script and configuration files - but, you have to fine an ISP that still provides a SLIP connection. I've been on-line for over 2 years now, and when I first contacted my ISP, he said he hadn't had a request for a SLIP connection in a long time (must have been another Atari user, ha-ha). So, IF you can find a SLIP connection, I may be able to help you but if not, there is a STIK-II in the works (currently being beta-tested), and it DOES have PPP support among other things. Or - you can use Sting, which supports PPP. I have heard it can be a pain to set up, but maybe you can get someone in your area to send you their scripts, etc. It would be really good to find another Atari user on your server - therefore his scripts will (supposedly) already be fine-tuned to that ISP.

Also, get the Serial CPX made by Peter Rottengatter for your Control Panel. Are you using HSModem 7? You do need that, too.

Don't despair or give up! You'll eventually get things going and be surfing the net with your Falcon. If you need more help - ask.

Hope that helps,

Clayton Murray
claytone@aa.net
Seattle, WA USA

Yes, such adapters exist.
.
> What do you think about ?

In my opinion this only makes sense if the UW hard disk drive including
adapter is cheaper than a standard SCSI drive.

> I also ask this because today it becomes difficult to find SCSI 1 harddisks

SCSI-1? You can connect SCSI-2 and SCSI-3 devices to your Atari. The
SCSI level has nothing to do with the bus width. Bus width and SCSI
level are not coupled, you can buy almost any combination.
SCSI-2 and SCSI-3 are backwards compatible to SCSI-1-CCS. The current
version 7.7 of HDDRIVER already uses certain SCSI-3 commands if
supported by a device.

1928. CAB JPEG Question

Newsgroup: comp.sys.atari.st
Date: 1999-04-30 00:00:00 UTC
From: Nurmix@NO_SPAM_MEsocal.com
Message-ID: <7gblqu$mrj@enews1.newsguy.com>
Source record: 79655

I was just curious. For a long time I used the CAB_JPEG.OVL that came with CAB 2.5 and 2.7 and everything worked well, albeit a bit slow. It was only later that I replaced that OVL with the DSP loader version from Brainstorm (that utilizes JPEGD.PRG in the AUTO folder). On average with the DSP-based loader, a JPEG that took 1:14 to load with the normal CAB_JPEG.OVL loaded in about 0:20 with the DSP-based loader. And since I had my Nemesis installed, the speed difference is even more dramatic. Unfortunately, not all JPEGs work with the DSP loader. This fact is even stated in the CAB 2.5 manual:

"[the Brainstorm DSP decoder] does not include any save routines, so thumbnail images will not be generated using CABALOG. Also this module does not support "progressive" JPEGS."

Well, I don't know what a "progressive" JPEG is, but I do know that I've done some testing lately (switching between the two decoders), and there are a few pages where no JPEGs are displayed when using the DSP loader. I assume these pages are using "progressive" JPEGs then?

My question: Is there an updated Brainstorm DSP decoder that _does_ support these "progressive" JPEGs? Or, is there some way to utilize both the DSP loader and the normal CAB loader at the same time? If not, that would certainly be a worthwhile update to CAB - have it use the DSP loader until it came upon a "progressive" JPEG, then switch to the normal CAB loader, then back to the DSP loader on the fly.

Any thoughts on this?

-Paul

Well, seeing everyone here talking about STinG 1.20, I decided it was my turn to try it. I first created some temporary directories to save my 1.15 stuff (just in case!), then copied over all the necessary files from 1.20. After setting things up appropriately with the CPXs and the dialer, I re-booted and gave it a try, and it worked the first time (using MagiC 5.11/NVDI 4.1/Nemesis "HI"/PPP connection).

However, I don't notice any speed increase or any real difference - other than the fact that the first time I disconnected, it "bombed" (I forget what MagiC calls the particular error, but with 1.15 it happened about 2 out of 10 times, and I was hoping 1.20 would have solved that little problem, but no. So much for first impressions!) ;^(

And by the way, the reason a "bomb-when-disconnecting" annoys me so much is that once that happens, I can no longer connect to my ISP unless I reboot and reload STinG. It will dial, then begin negotiating, then just hang. Interestingly, it will work [post-bomb] if I dial my other ISP that uses SLIP. But as I said, in order to connect again [after a 'bombed' disconnect] with my PPP ISP, I have to reboot/reload STinG.

And after that experience, it seemed to work ok. But today it was either DRVIN or SCC that wouldn't load properly, and STinG wouldn't work. I don't know how or if the files got corrupted, but I have been messing with my Falcon and it's resolutions and AUTO folder programs quite a bit lately - playing around with Nemesis / Videlity a lot, and also trying out boxkite. I copied the HSMODEM stuff over from a backup, and did some AUTO folder cleaning and rearranging and it's working now, so who knows what I did!?

> this before. Could the Falcon have a different type of parallel port
> that causes it to bomb out? I've ruled out the OS, since I've run it
> under MagiC and GEM.
>
> The main goal with this is actually to see an increase in cps - I don't
> get nearly the throughput I was expecting with a 115kbps serial link, so
> I figured I'd try the parallel port. Anyone know what rates to expect
> and how fast the Falcon's port is?

I also tried using the plip-driver of sting 1.15 for connecting my two
falcons together, but I never got it to work. In the docs it says
something about the plip-driver not being supported by the sting kernel.
In the sting 1.20 package the plip-driver wasn't even included (not in
the one I got from Ronald Andersson's page anyway), and the docs from
that package also states that the plip-driver isn't supported by the
sting kernel.
Yet, in the docs for the masquerade-stx (by Ronald Andersson), he says
that he uses a sting based network consisting of Midi and Plip-cables.
How is that possible then?

When transferring data between my two falcons using parcp3.01 I got a
transfer rate of 60000 to 70000 cps, the highest I've seen is around
74000, so it's a lot faster than nullmodem.

/Henrik

>for first impressions!) ;^(

Hi Paul,

well, I'm running on a TT as you know, MagiC 5.01... I've experienced the
same stuff (it's # 69 that's reported then), I found the cure for this was
carefully re-arranging the autofolder sequence. I'm using X-Boot for
several configs too and also found out that sometimes when renaming a .PRG
to .PRX the physical place changes. For that reason I started using an
AUTOEXEC.BAT with MagiC, this one won't change and overrides the actual
Autofolder sequence. Therefore, even when some prg moves to another
location in the auto, the running-order won't change.
Now the Falcon may be a different piece of cake, but you could try to
experiment with it. I'll supply my Autoexec.bat which gives me a rock-
steady bunch. A small change however and the bombs are back in town.

METAXBS.PRG (my replacement for Metados)
REDIRECT.PRG (needed for my graphics card)
MAGXBOOT.PRG
NVDI.PRG
MAGICOOK.PRG (needed for Stella and a few others)
LIBERTY.PRG (needed for Freedom)
WDIALOG.PRG (ermm, let's not discuss this one)
DRVIN.PRG
MFP_TT.PRG
SCC.PRG
ADDMEM1.PRG (to prevent the "out of memory" messages, 3 did the trick)
ADDMEM2.PRG
ADDMEM3.PRG
SLCT_DEV.PRG (needed for rez changes here)
STING.PRG

>And by the way, the reason a "bomb-when-disconnecting" annoys me so much is

Exactly the same here.... but the Autoexec.bat helped a lot here.

Then of course there's the bunch that runs from /Magic/Start/... like
Xmenumanager, Popfold, Keywatch, Calendar, Tos2Gem, Bubble, Multistrip,
Menu-3D, Gawdknowswhatsinthere, maybe all adding to the fuzz...

Then NVDI kicks in a few apps for my card, some prg's are coupled to Olga,
well all in all this system's gonna look like WIN-98, sometimes I feel
like I'm losing control of the whole system here :-)
>
>And after that experience, it seemed to work ok. But today it was either DRVIN

>rearranging and it's working now, so who knows what I did!?

Good idea, cleaning up your system. I did it not so long ago, removing all
those Whatever.prx, Whatever.old, Whatever.sy1, Whatever.syx and you-name-
it files from the setup. Even now I still have several GEMSYX, GEMSYS.OLD,
AUTO-1, AUTO-2, AUTO.OLD dirs sitting on several partitions, probably
filled up with even more crap, but sometimes they come in quite handy to
temporary set up some test setup. I've got 8 partitions here accross two
HD's, each one has at least one Auto and Gemsys, and one X-Boot to
complicate it even more :-) In other words: enough to fiddle around with
and sometimes I think "how the hell is it possible that it all runs OK?"

1935. atari stuff for trade

Newsgroup: comp.sys.atari.st
Date: 1999-04-30 00:00:00 UTC
From: ethh@enemy.org
Message-ID: <7gc2pt$i61$2@news1.skynet.be>
Source record: 79662

i'm willing to trade atari stuff for atari stuff.

at the end of the list, there is some other non-atari stuff to swap as well
but i'm only interested in atari stuff, don't propose other stuff or money.

i'm in belgium so consider the postal costs accordingly.

tags: games title have tags. these are: "b" to say it comes with the box; "d"
to say it comes with the doc; "f" to say it has no value to me and that it is
free to give away along with any other swap.

bargain by e-mail only.
===
i propose:

lynx games: ishido (bd).

jag games: kasumi ninja (bd), myst cd full version (bd).

a working jaguar without joypad, with alim, scart cable (d).

n64 games: turok2 seeds of evil (bd), zelda ocarina of time (bd).

pc games (that work under plaindos): might & magic 4 (not the reedit) (bd),
realms (bd), ultima vii data disk (forges of virtue) (bd), ultima vii ii's
data disk (serpent seed) (bd), shadowcaster (bd), arena the elder scrolls
(bd), f-29 lightning ii (fbd), f-16 fighting falcon (game text in german)
(bd), ultima underworld i (bd), ultima underworld ii (bd), flying corps (fbd),
flames of freedom (bd).

pc joysticks: 2* quickshot v (2-buttons flight simulator stick with adjustable
x&y sensitivity), and 1x gravis gamepad (with drivers).
===
i'm looking for:

a tt-ram card fully fonctionnal that can carry at least 8mb andor 4mb 30pins
60/70ns simms.

any lynx games, particularly: slime world, ms pacman, asteroids/missile command.

any jag games, particularly: worms.

any st originals, particularly: starglider ii, superwonderboy in wonderland,
ghost and goblins, ghouls & ghosts, elite, castle master 1&2, viking child,
tower of babel.

mouses for atari.

in order to burn them and put the pictures on the destroy microsoft website,
free original microsoft products of high value with box and docs (you won't
ask for something in exchange for those).
===

Seems CHGRES.PRG stores its settings in C:\AUTO\NVDIPC.INF. Only the
predefined resolutions are in the binary. Since the format of this
INF file is unknown to me, I think you can just erase it and reinstall
the resolutions you're actually using. There are no other useful info
in this file as far as I can tell.

Sorry for my mistake, it was not the Powell Group, but the Yost Group.
I just got the two names mixed together Gary Yost and Jack Powell.
Also the URL to kinetix is http://www.ktx.com

>> Most of the guys from Antic is in the Powell Group. Tom Hudson,- Gary Powell >>and some

Erm... not quite. StinG has neither NFS nor Samba.

MiNTNET has both of these. http://yescrew.atari.org/
is a good place to start for info on recent mint stuff.

I haven't seen that one in awhile (though I *used* to see it
regularly), but I do have the occasional lockup during the
negotiating handshake. I lose the mouse pointer and then get a very
hard lockup. That is, no way to reboot via the keyboard and even the
reset button is shakey. Unfortunately, v1.20 didn't help.

Personally, if I get any kind of crash, I want to reboot at the next
available opportunity, even if everything SEEMS fine. You're just
playing with fire using a system that has crashed. It may LOOK fine,
but some ugly things could be lurking.

Okay, okay, some of you can go ahead and say "I told you so"
but...

I've posted several times about my Ram problems with my Nemesis
installation. Well, I had not tried Nemesis "HI" since I upgraded
to HDDriver v7.61 from ICD's Pro Utils v6.5.5...

So, guess what? It works fine in Nemesis "HI" now!!! Yipppeeee!

Hard to believe that hard disk software would interfere with a
CPU upgrade but, there it is. The proof is in the pudding and
all that...

I'm now running at 800 x 608 x 256 colors, with a CPU speed of
25mhz, bus 25mhz, FPU 50mhz, and DSP at 50mhz...my, my, my,
but MiNT is even snappier now! I can just imagine what Jo Evens'
AB040 or K.Ellis' Centurbo2 equipped Falcons are like! ;-))))))

BTW, has any Falcon owners with a C2, and a FPU, running MiNT,
tried out the MP3 software yet? Thanks!

hmmm, that's strange... it's still full ops. Did you try a ping to the
site when you could logon?

The address still is : ftp://193.190.205.13/atari/

When did you try to access it. The site was down a moment this week. But
I think it wasn't on Monday or during the week-end.

>Isn'tit???

Rein, it is!

Sheer coincidence, but I picked up 7.09A demo from ROM's site this
afternoon. I was on 5 demo, that one crashed at printing.
This one doesn't, but reports bus-errors when I try to adjust the printer
stuff. Prints are fine, tho'.

I think it will be the first S/W I'm gonna buy, looks really good.
I believe there is a Dutch version as well? It's about time to kiss That's

For what it can do, it is cheap. They are hard to find.

>
>I'd be very interested in any up-to-date back up parameters that you
>have;)

Well, I have the original disk that came with the originally released
backup parameters.
Also I have several disks that update some of the files and backup
parameters.
I have about 5 different backup parameter files, the largest one
is over 10,000 bytes in size and if I remember correctly it has
at least 70 different ways to backup disks. ;)

Also on one disk is 2 programs called Happy20 and Happy30 which
gives a sector by sector display when backing up a disk.
I think it is also sometype of disk editor as well.
I've not really used those programs. If any one has, any details
on them and how they work as compared to the original program
used to backup disks would be helpful.
>

I plugged it into the STe last night and messed around with it a bit
more. The docs also describe how to use MAC 128K Roms in the Happy
cartridge. ;)

>

>CD!!!

Yes, it is suppose to be able to copy just about anything.
I'm not sure about high density disks. I only have the standard
double density drives for my STe.

It would be great if the Happy Discovery Cartridge would work on
the Falcon. Has anyone tried that?

I had forgot about the ability to copy disks into a file. :)
Steve you have given me a good idea. ;)
Mostly I just used the cartridge to back up some of my most
used disks that have copy protection on them.
Floppy to File is interesting. ;)

Not sure if I want to sell it now or not. ;)

Steve, Can you copy Floppy to File directly to a hard drive?

>
>I don't usually stick my oar in on items other people have for sale. I

Source record: 79687
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,alt.atari

I'm using HD driver v7.51 with an ICD Link II and I can't get it to see an MO optical drive or one of my Pioneer multi CD changers; I couldn't get it to see a PD drive either!!

I have even tried the devices on their own.

The ICD software detects them! But I want to use the DOS compatibility mode that HD Driver offers.

Anyone got an idea! I've been fiddling for nearly 5 hours and getting a little ######## ###!

Hallo Ashley!

AS>Any solutions anyone?

Has there recently been a modem upgrade at the provider? E.g. are the reported connect rates higher (V.90 type, 44000 or above)? In this case, the connection might be unstable, forcing the modem to try a retrain immediately after connect. In that case, the initialization will time out because during retrains there is no data transfer possible.
If this is the case, you could try to set the maximum connect rate to a lower speed, e.g. 44000, or even disable V.90.

If you sort this out, let me know. I can get STinG to dial and connect, but then it slows to a crawl (if it starts at all) and stops. The irritating thing is that I couldn't get it to work at all at first, then it did work, then it stopped again. Never been able to work out why.

If you can't get any response from the modem at all, the only thing I can think of is that MPC's COM port setting might be set to use the wrong port. Even if everything else is wrong I would have thought you could send a dial string to the modem if that was set correctly.

>From: guitarra@afn.org
>Subject: In Search of JIm Kent?

For all I know, he has been doing something for the Autodesk company. At least
he did a conversion program that handles most Amiga, Atari and some more, formats. It was
running on a PC. He might have been a part of the Powell Group
that is now doing 3D Studio Max. Try a search for kinetix.com or is it
kinetic.com ? I havn`t been abel to track Jim Kent on the internet yet.

Most of the guys from Antic is in the Powell Group. Tom Hudson,- Gary Powell and some more
I can`t remember, but I havn`t seen Jim Kents name there.
Anyway,- I remember the first time I had a look at 3D Studio on a PC, it had the look and
feel of CAD3D and the Cyber Studio on a ST.

I told my college at work, that this program looks like something developed by Jim Kent and
Tom Hudson on a ST, and certainly, it was.

Naturally they,- my college, didn`t know who I was talking about, so I told em.
And almost naturally, they didn`t belive me, as always when I spoke about what was possible
on a ST.

> I dream of having a program Cyber Like in high ress for Falcon! (Apex is >missing Cyber's
ADO effects)

Have you ever had a look at NEON? Or try xenomorph, it ain`t the same, but it
works with 3D2 files.

cheers

1966. Re: STinG 1.20 - Where's the old TCP.ST

Newsgroup: comp.sys.atari.st
Date: 1999-04-30 00:00:00 UTC
From: leaver@dynamite.com.au
Message-ID: <7gau7qhmq1@black.interact.net.au>
Source record: 79744

Ronald,

First, thanks very much for your detailed response.

I should have included a few more facts.

My DEFAULT.CFG settings are essentially those from the STinG release -

```
ALLOCMEM = 100000 (I think this is 160,000 in the release)
#
THREADING = 50
FRAG_TTL = 60
#
ICMP_GMT = -60
ICMP_AD = 10
ICMP_FLAG = 0
#
TCP_PORT = 1024
MSS = 2000
RCV_WND = 5000
DEF_RTT = 50
DEF_TTL = 128
TCP_ICMP = 1
#
UDP_PORT = 1024
UDP_ICMP = 1
```

The TT's Serial 2 at 115.2, the MSTe's at 57.6 although 115.2 seems to work ok.

Under STinG 1.15 the STinG Port CPX reported an negotiated MTU of 576.

Under STinG 1.15 the MSTe was nearly as fast as the TT. That is, the MSTe was readily achieve > 2,700 bytes/second with the same settings that I am using for STinG 1.20

I'll try some more experiments and report further.

Before Dawn always seemed pretty stable to me, I never had any
problems with it, exept when I tried to run it in conjunction with
Silkmouse (Mouse Accelerator etc) whereupon it hung as soon as the
screen saver became active.
I found the lack of colour a bit boring though and switched to Screen
Artist, which is pretty stable and a lot more intresting....

1969. FPU on MegaST?

Newsgroup: comp.sys.atari.st
Date: 1999-05-01 00:00:00 UTC
From: Joakim H&#65533;gberg <gokmase@my-dejanews.com>
Message-ID: <7gfj9fada1@nnrp1.dejanews.com>
Source record: 79547

Greetings all,

I have heard that it should be possible to add an FPU to the Mega ST. Is this so? I have recently bought a Mega ST4, but I wonder where the FPU would fit?

Regards,

Joakim

If you are using an editor which has wildcard search/replace (eg Everest),
just search for <*> and replace with nothing. This will clear out the vast
bulk of the HTML, just leaving a few special character entities (the ones
which start with &).

Or you could use something like HTML-Help to convert to ASCII.

Hmmm...I wonder if that's why I haven't had that happen lately -- I
haven't used NEWSie in quite awhile. Maybe there's a conflict there.

Hi!

John Whalley <news@whalley.demon.co.uk> wrote:
> If you are using an editor which has wildcard search/replace (eg Everest),
> just search for <*> and replace with nothing.

Careful, depending on how the expressions are matched, you'll completely mess the text up. The important question is: does the matching engine search for the smallest or the largest possible match?

An example. Assume you have an HTML line like this:

I don't like Mondays

Now, does "<*>" (or "<.*>", which is a regular expression) match just "" and then "", or does it match "I don't like Mondays"? Both is correct, since the expression just said to match a "<" followed by zero or an unlimited number of any characters, and finally closed with ">" - it didn't say not to match ">" for "*" (or ".*").

Real regular expressions (like in vi, sed, awk, ...) usually choose the leftmost longest match, which is the complete line in the example.

To be on the safe side, search for "<[^>]*>" and replace it with nothing. Of course, this only works with regular expressions and means: Match "<", followed by zero or an unlimited number of any characters, but not ">", closed with ">".

I know this looks awful, but once you get used to regular expressions, you really miss them in editors that don't support them. And note that they are not only useful for programmers, as this example shows.

Finally, if you have a working port of sed, the "Stream EDitor" (a UNIX filter, i.e. it reads from and writes to a stream, where a stream may be a file, the keyboard/screen, a device, and so on), you can easily remove HTML-tags (but still not the ISO entities) with

sed -e 's/<[^>]*>//g' < file.html > file.txt

from within a CLI like Mupfel.

Ciao

Thomas

P.S.: One important drawback of regular expressions: It's relatively easy to write them, but never even think of understanding them again when you look at them some time later ..

Source record: 79555

Hallo Ronald!

RA>Have you tried networking the two machines over MIDI ?

I tried today with my two Falcons, but no go :-(

- there came no midi.stx with sting 1.20
- on one of the two falcons, neither stingport.cpx nor dialer offer the midi ports
- on the other one, the port is available, albeit there is no midi.stx, too. But it seems not to be working either, because when I watch the midi port on the other machine with a terminal program (starcall), I won't see any byte coming in. I've been trying it with the dialer's "ping" function. Once connected (success="direct") and ping initiated, the statistics window showed bytes going out, but they did not arrive at the other machine.

I've got my local intranet working between the milan and one of the falcons, but I'm not able to bring the second falcon on-line. I can't use the lan ports due to lack of appropriate cables, so I'm stuck on midi for now :-(

Configuration: Milan 040 with MiNT/M.AES, 2x Falcon 030 with MagiC 5.13 each. Modem connected to modem2 port of the Milan, one Falcon connected with it's modem2 port to serial2 on the milan. The two falcons connected together with midi cables. HSMODEM on all machines. With a terminal program on both Falcons, the midi link works okay in both directions.
STinG Version is 1.20 for all three machines.

I got yet another problem: any time I connect to my ISP, the first try will fail. This means, the modem will connect okay, the ppp negotiation works (got IP), but then no single byte comes in. Disconnect, try to reconnect: no response from the modem. Quit dialer, restart dialer: connect is possible again, and everything works.
Must be some strange problem with my MiNT setup, but I don't know where to look at :-(

btw, i'm looking for this hsminst.xdd thing and also for rsvx.prg. Tried 5 to 6 search engines on the web today, with no result. HELP!

mit freundlichem Gruï¿½ aus Bubenreuth

I am using a 28k8 bps modem on my Falcon030 with the serial .cpx set
at 19k2 bps - for some reason I can't understand I can't get a
reliable connection at a faster serial port speed than this - and yes
I am using HSModem (does anyone have any ideas on *this* problem!) and
my friend uses a 14k4 bps modem on an STe with the serial .cpx also
set at 19k2 bps. STinG reports at connection at 19200 bps, before the
initialisation times out :-(

So trying to run at too high a speed shouldn't be an issue ;-)

Thanks for the suggestion though :-)

First of all I tend not to log off POPwatch but leave it running in case
any more mail comes in whilst I'm downloading ng with Newsie or using
CAB.

If I get bombs with STinG when I do log off POPwatch or it happens
anyway, I simply "tidy up" in MagiC and everything works fine again and
I get no re-occurence of the bombs.

Ronald,

There is something that I should find very useful if some kind soul
could produce it.

It would be:-

A list of STinG configuration variables

classified by

Those variables that must be set
Those variables that may optionally be set

Those variables that, if set, must be set in DEFAULT.CFG
Those variables that, if set, must be set in DIAL.SCR
Those variables that may be set in either file.

At present I reboot to change ISPs. I suspect that this may not be
necessary but at present I have ISP specific things in DEFAULT.CFG

>(Is my memory as bad as that???)

You did report an MTU setting of 576 for both your machines earlier.
If that was based on data from the MSTe then this could explain some
of the difference in their performance. The MSS size difference would
almost triple the overhead costs of IP and TCP headers for all large
block transfers.

>Second, I have never taken much interest in STinG Protocols CPX. I
>thought that it was for local stuff only.

That is not the case, but normally one should not need to manipulate its
values, since they are all initialized by DEFAULT.CFG too. That makes
use of this CPX optional. It is very useful when making experiments to
find the best values to use, but once those are found there is no real
reason to use the CPX. Just make sure that DEFAULT.CFG has all values.

>MSS is shown for TCP as 273
>(again this is on the TT and I am currently on line).

Eh ? But that is a nonsense value !?!
That should make transfer extremely ineffective.

You should edit it to be MTU-40, or in this case 1460.
(And don't forget to save it.)

Also, since you seem to be unsure about it, doublecheck with your ISP
that they allow an MTU of 1500. If not, use the largest that they do
allow, and use a value 40 units lower than the MTU for the MSS. Then
check that your RCV_WND setting is at least a little more than twice
as large as MSS. My own setting is quite a lot larger (about 8 times),
but RCV_WND must not exceed 32767, because it is stored as a 16bit
'signed' value.

Finally go through all settings for both machines, both in DEFAULT.CFG, CPXs, and DIAL.SCR, checking that all settings are identical except for the local port IP numbers. The latter must differ of course, to make a LAN functional.

After that I hope you will finally get consistent performance from the two machines. I can see no reason why they should not work equally well, except at the top BPS speeds which only the TT is fast enough to cope with.

Oh...
IIRC this is the first time you have mentioned having two ISPs.
That means that you must use two different dialer script files, and
each must contain the correct MTU setting for the ISP to be used.

>Installing the correct version of the CPX had no observable effect on
>the TT, apart from letting me see what is going on. However the efect

>tolerably well. CAB typically reports speeds > 2,000 bytes/second.
>However, Dynamite (MTU = 1,500) is now worse. Whereas previously data
>arrived slowly but steadily, now it comes slowly and with breaks.

This may be be due to MSS mismatch. The setting in CPX and DEFAULT.CFG
should match the higher value allowed by your ISPs. It will always be
limited to the currently active MTU-40 anyway, and if MTU is correctly
set in your dialer scripts this will adapt the MSS automagically. This
means that you should set MSS to 1460, both in DEFAULT.CFG and in the
CPX (and make sure that both are saved to disk).

According to another recent post your CPX setting for MSS was 273, and
that was probably a major factor in your problems. The 'automagical'
adaption of MSS only works downwards, when MTU-40 is lower than the
preset MSS. If MSS is preset lower than that, this preset value will
be enforced, which in your case would lead to inefficient handling of
packets, and that effect would be much worse with Dynamite's MTU.
(So this time the differencies begin to make some sense.)

>work properly.
>
>7 different people sent me their configurations and all 7 are completely
>different.

Hardly 'completely' different since some values are fairly standard, such as 'FRAG_TTL' etc, that no ordinary user needs to experiment with. But of course a lot of things need to differ for different users having different needs. Some use STinG both for Internet access and for local networks, and those will naturally use more complex setups.

>I finally got it dial in but it negotiates successfully with absolutely
>nothing - at least not my ISP. Starting CAB or telnet renders and

Which CAB.OVL and which telnet program do you refer to ?

CAB itself is not a client of STinG, or of any other TCP/IP stack. CAB handles all such needs through the CAB.OVL, of which many versions exist. The CAB.OVL supplied with CAB itself by ASH does not work with STinG. Instead you will need either the CAB.OVL written by Dan Ackerman or the one written by Olivier Booklage. Links to both of them can be found on my STinG pages. (My homepage URL is in my SIG below.)

>'resolving host error' in both

Since your other remarks make it very clear that your login was never completed, it is obviously not possible to contact the DNS server to resolve host names. An error message is what you should get here.

>as although it told me it's connected, it's not.

I assume that you are talking about the CAB.OVL here. All CAB.OVL use some test for connectivity that is meaningless relative to STinG. In a local STinG network it is possible to reach web servers even if not connected to any ISP. The correct method is to configure CAB.OVL to believe that it is always connected. Attempts to contact URLs on Internet will still give error messages when no route to them exists (ie: when not logged in to ISP).

>It won't allow mw to change ICMP to TCP and save it.

I don't see what you mean. ICMP and TCP are entirely different protocols, and exchanging one for the other is not possible. The only dialogs where both names appear is where you select the protocol for which you currently wish to view version data or edit parameters. You have misunderstood the

purpose of that selection. It is not to activate a protocol, since _both_
protocols have to be active, for normal transfers to work.
(ICMP is used for error messages of both UDP and TCP.)

>It refuses to
>save 'STING.PRT' anywhere at all, simply giving a 'file i/o error'.

I am quite certain that you are wrong in this, or have corrupt files,
or that you have forgotten something really basic, like setting up
the STinG module path in STING.INF. I have never before heard anyone
complain of an inability to save STING.PRT, and I have been involved
with STinG beta testers since before the first STinG was released to
them. This inability is due to some problem at your end.

>Every time I change the control panel settings, it won't let me save any
>of the changes and resets them back to the basic (incorrect) settings as
>soon as I exit.

Which CPX ? STinG is supplied with four different CPX.

But again, it is quite clear that you mistake 'selection' for 'activation'.
The purpose of STNGPORT.CPX (for example) is _not_ to activate a single
port and set its parameters. Instead it allows setting the parameters of
all ports, and one of the parameters is the activation, since STinG does
allow simultaneous use of all ports for local networks.

The port to be used for ISP dialup, however, should _not_ be activated in
the CPX, since that will be done automagically by the dialer, provided that
it has been properly configured of course.

>I also got a 'numerical character or dot expected (Ignored!) and a 'Hmm'
>button (whatever that's supposed to be.) What does this message
>mean and what is it looking for?

It means that you have used the macro command $GET_IP in a dialer script,
in such a way that the data it receives from the ISP is not a proper IP
address in so-called 'dotted IP' format. Such an IP must consist of four
groups of digits separated by dots (eg: 191.43.120.1).

Scripts of this kind are usually not needed for a PAP login, so when this
is the case you should simply erase all the script entries.

>What is wrong with STinG

Not much, as far as I know. :-)

>and why is it so hard to set up. I set up my PC PPP in 15 minutes.

That is not comparable. Those simple PPP packages, so easy to configure,
have only one single purpose, which is to connect you to the Internet.

STinG on the other hand is a full-fledged TCP/IP networking stack, with
the ability to connect to other such networks, including the Internet.
If you have to compare you must choose something with the same purpose
to compare with, such as the networking parts of Windows NT, Linux, or

something like that. And they are not easier to set up than STinG is.

>A year later, still no STinG! GAD!

STinG is here, but it needs to be configured as a networking system,
since that is what it is. Attempting to configure it simply as a
primitive dialup utility is bound to fail.

>The instructions don't help either.

Have you really read them ? All of them ?

I know that the doc's need improvement, but you seem to have missed
the basic purpose of STinG, and that should not be possible if you
have read the entire hypertext.

>Anyone else like to try?

Actually many already have, with successful results, and I'm sure that
if you give it your best shot you can do so too. My comments above
should help clarify some of your problems, so I advice you to try again.

>Hallo Ronald!

Hi Ekkehard,

>RA>Have you tried networking the two machines over MIDI ?
>
>I tried today with my two Falcons, but no go :-(

Ok, but try again ! I'm sure we can sort this out.

>- there came no midi.stx with sting 1.20

It is not needed for simple Midi networks, and in fact that module has never
been completed. The one included in the earlier releases was just a rough
skeleton driver that lacks a lot of stuff needed to make it useful.

At present Midi networks suffer a packet delivery delay of a full packet
transfer multiplied by the number of machines in the ring between sender
and receiver. With the MIDI.STX (if it ever is completed) that delay can
be cut to a single byte transfer multiplied by the number of machines.

But delay is not all that important in an IP network, as long as the BPS
rate is decently high, and the 31250 BPS of the Midi ports make them the
fastest serial ports available on standard ST/STe machines.

>- on one of the two falcons, neither stingport.cpx nor dialer offer the midi
>ports

The first means that you have missed installing the HSModem module MIDI.PRG,
and that explains the rest of your problems described below.

The dialer will never offer "Midi" as an alternative for modem dialup, as
the "Midi" port is not able to control a modem. It lacks the extra I/O
lines needed, and the voltage levels are completely wrong.

>- on the other one, the port is available, albeit there is no midi.stx, too.
>But it seems not to be working either, because when I watch the midi port on
>the other machine with a terminal program (starcall), I won't see any byte
>coming in. I've been trying it with the dialer's "ping" function. Once
>connected (success="direct") and ping initiated, the statistics window showed
>bytes going out, but they did not arrive at the other machine.

First, I don't see what you mean by connected. One does _not_ use the dialer
to 'connect' to other machines on the LAN. They should remain connected at
all times, so they need to be activated in STNGPORT.CPX. The dialer tools
can then be used for these IP addresses too, without using the 'connect'

button.

In this particular case no communication is possible, however, since you did
not have any "Midi" port on the other machine. For this you must install
the HSModem module MIDI.PRG, and it must start last of the HSModem modules.

You must also use SETTER.TOS to enlarge the buffers of MIDI.PRG, since the
default size is only 256 bytes, and the MIDI ports have no handshaking.
I use transmit buffers of 4 KB and receive buffers of 16 KB.

----- snip ----- re: your setup

Sounds fine to me. I think all problems will clear up once you install and/or
activate MIDI.PRG on the second falcon.

>I got yet another problem: any time I connect to my ISP, the first try will

>response from the modem. Quit dialer, restart dialer: connect is possible
>again, and everything works.
>Must be some strange problem with my MiNT setup, but I don't know where to look
>at :-(

I don't know either. I don't use MiNT much, but I test stuff under it now
and then, and I do not get this problem

Still, you could try connecting the modem to one of the Falcons instead.
Since they use MagiC that might work better.

>btw, i'm looking for this hsminst.xdd thing and also for rsvx.prg. Tried 5 to 6
>search engines on the web today, with no result. HELP!

Well, I hope someone else can help you with those.
I've never used either. What are they needed for ?

Ah, but that's the rub of course.
Someone will have to take time to do it, and it has to be someone
that knows all of it and exactly how STinG uses it.

>It would be:-
>>A list of STinG configuration variables classified by
>
>Those variables that must be set

For the present, assume that all variables present in the DEFAULT.CFG file
distributed with STinG are needed, in the sense that you should not remove
them, though you may edit their values. And never edit a numeric value if
you are not sure what it stands for.

>Those variables that may optionally be set

That set is extensible, since some are defined by clients, and ignored
completely by the kernel. The kernel is just used to store and fetch
such variables, but it doesn't care what their values are.

>Those variables that, if set, must be set in DEFAULT.CFG

For now, assume those in the distributed file are needed.

>Those variables that, if set, must be set in DIAL.SCR

Similarily, assume that all variables used in the distributed DIAL.SCR are
needed, except for user defined script lines which are to be erased to get
pure PAP login. Also, avoid manual editing of the file. The dialer can
be used for all changes needed, except the extra environment variables
(needs more work by Peter) and will never remove a required variable.
It will also retain extra environment variables that you have placed
properly in the file with a text editor.

So, save the commented original file somewhere, and then use the 'Configs'
dialogs of the dialer to make most changes. Saving an altered script file
kills the original comments, but it does group all settings sensibly, and
also adds a header comment to each group.

To enter extra STinG environment variables, use a normal editor to insert them under the header comment "# Network Environment", in the same form that the variables in other groups have.

>Those variables that may be set in either file.

Optional variables may be used in either file, and duplicates are allowed, since the values defined by a dialer script file then replaces the values defined by DEFAULT.CFG.

>At present I reboot to change ISPs. I suspect that this may not be
>necessary but at present I have ISP specific things in DEFAULT.CFG

I assume this means that you have different DEFAULT.CFG files as well as different DIAL.SCR files. Only the latter are really needed. Everything defined in a dialer script file will at dialup time replace corresponding things that were setup at boot time from DEFAULT.CFG, or such as were set by a CPX when XControl (or equivalent) started up.

Clutching at straws here, it's not a drive mapping problem is it? By which I mean, are your STinG files on the same "drive" letter under MagiC-PC as they were on the Falcon? If not, have you changed the relevant .INFs to point to the new locations?

Apologies if you've been round this particular mulberry bush before.

I have often got 2 bombs when disconnecting STinG. Then if I try to
run the dialer again everything locks up.

But, since removing the default route in my ROUTE.TAB no more bombs!
It's been 4 days now and I'm hoping for the best.

I have the dialer setup to "add default route through port". If the
default route is already present in ROUTE.TAB there might be a problem
with adding another one. Don't know really.

If you only use STinG to connect to your provider (no LAN) there is no
need for a ROUTE.TAB at all! Also delete STNGPORT.CPX and STING.PRT as
they only make sense on a local network.

If you only use STinG to connect to your isp (no LAN etc.) and you are logging in with pap and get the nameserver address from the isp it's very easy:

Delete or rename to eliminate wrong configs:

C:\CPX\STNGPORT.CPX
C:\CPX\STNGPROT.CPX
C:\STING.PRT
C:\STING\ROUTE.TAB

Copy a fresh DEFAULT.CFG from the STinG distribution!

In the Dialer - configs - port parameters:

IP Address: empty
MTU 1500
PAP ID and Password
PPP checked

and don't forget to click on "Accept"

In the Dialer - configs - Addressing:

(User name, full name and domain are not used by STinG itself but other program may use the settings.)

Check "Request name servers from remote"

Click "Accept"

In the Dialer - configs - Phone & ISP Cost:

Number: If empty first click on "Add" (sic!), enter number and click on "Accept". If a number is already present, change it and click "Accept".

In the Dialer - configs - Miscellaneous:

Select the serial port to the one your modem is connected to.

Check "Add default route through port" and click "Save" to save the settings in DIAL.SCR

In the Control panel - STinG Internals

Check "Active" and save.

In the Dialer:

Click on "Enable" and "Connect" and enjoy your new setup :-)

>At present I reboot to change ISPs. I suspect that this may not be
>necessary but at present I have ISP specific things in DEFAULT.CFG

Don't touch DEFAULT.CFG at all!

I have tried to run with two isp:s as well and it works perfectly. I don't even have to restart the dialer itself. I simply diconnect, disable, click Configs and doubleclick on the filename to select the new one, close the config window and connect to the other isp. Just tested while writing this, btw.

I'm running Geneva-Neodesk.

MIDI.STX is only a dummy. This module will (if it gets written) provide
a "circular" ring network with several computers.

To use MIDI to connect only two computers the MIDI port is treated just
like any other serial port. You will need the hsmodem MIDI.PRG present
in your AUTO folder.

2004. SH205 Driver search

Newsgroup: comp.sys.atari.st
Date: 1999-05-02 00:00:00 UTC
From: ubehning@bremnet.de
Message-ID: <7sqcbYK2lgm5-pn2-D7mYeMCFGI1b@localhost>
Source record: 79577

Hello!

I have here a Atari SH205 Hard Disc, but not the Driver to format etc.
the Drive.

Can anyone send me the Tools, or get me a Site whre I can download the
Driver?

Thanks

Ulrich Behning

No guarantees, but you might like to check my step-by-step guide at:

http://www.whalley.demon.co.uk/atari/texts/stingset.html

It might at least throw light on something you've missed.

2007. WTB: MEGA-STE motherboard

Newsgroup: comp.sys.atari.st
Date: 1999-05-02 00:00:00 UTC
From: Martin-Eric Racine <q-funk@pp.fishpool.com>
Message-ID: <Pine.LNX.3.96.990502151200.10609A-100000@hal.fishpool.fi>
Source record: 79580

Years ago, Toad advertised some MEGA-STE motherboards that were complete
machines, less ram SIMM, TOS roms or power supply.

I recall someone buying their overstock on those, but cannot seem
to find the link about it. Does anybody know?

I want to build myself a tower-mounted fileserver, so I would rather
start with a motherboard than having to disassemble a MEGA myself.

Can you see your TR led on your modem changing state when you click on
'Enable' on the Dialer ?
Do you get any message when you click on Connect ?

Also, is your laptop a Pentium? How fast ?

Hmmm, many questions, but don't forget that MagiC PC is an emulator
(ok, ok, an alternative OS ;-) but has to emulate a MC68000 on the PC,
and if it's not fast enough, interrupts are slow and can definitely
cause problems to STinG or even HS-MODEM modules.

For comparison, I'm using it on a 90MHz old Pentium, COM2 port at
115200bps (Modem 1 for MagiC PC) with downloads hardly below 5000cps.

I'm also using BNeT or FTP Server to connect to my TT and Falcon
without problems (although I had problems with STinG 1.15).

Last note: make sure your cable to the modem uses all signals
ie RTS/CTS etc and that you have set SERIAL.CPX to the speed you
have in MagiC's settings and the 'FlowCTRL' is RTS/CTS.

Hi

I've not idea, it's in an STE in a Desktopper case I bought! I don't
under stand why a separate board that takes up 2 SIMM slots and has 2
meg onboard would be needed to upgrade to 2/2.5 meg!!! And then has
another 2 SIMM slots on it's board; wouldn't it be easier, and cheaper,
to upgrade it will 2 SIMM's directly in the STE!! Unless it has another
purpose!

According to the fitting instructions, I can't find any.

I would be more than grateful if you could find which mag it's in, if
any. I have all but 2 ST Reviews, I started selling up before I realise
that the Atari user had trouble finding software;) and I sold 2 copies:(

At the present I am battling against the effects of the drugs I'm on, 2
kids, and trying to get something on my web site along with sorting the
former LAPD library disks out.

>
>6 MB ATARI STe with Veloce+2
>NVDI TOS 2.06 MagiC Thing
>

Can you also give me some info on how to increase the STE's memory
beyond the 4 meg max.? as I see yours is above;)

Thanx

The hard drive doesn't have any special driver for it. Atari's HDX came
with the drive, this can be found on any good FTP site, BBS or PD
library;)

I found that other hard driver packages are just as good if not better
than HDX.

Any hard driver worth it's salt should do away with the need to having
the folderxxx.prg in your AUTO folder.

At the moment I can't put my finger on the disk in my library. This due
to being surrounded by disks.

I keep dreaming of posting a letter in a letterbox and a million red,
white and blue floppies fly out!!! I put 4 slices of toast in the
toasted, and 8 black disks pop up. Put a video in the vcr, instead of
the Terminator I get the 'It'll be black' Formatter! and High Society
ends up being High Density!!!

"Good things come to those who wait."

And wait.....
And wait.....
And wait.....
Then reboot...
And wait....
And wait...
And wait...
Then reinstall Windows....
And wait....
And wait...
And, oh sod it !! may as well get a ST they maybe be not P200+ in speed but
the time you save not having to reinstall every 4 days it works out a lot
quicker in the end anyway :-)

Hi all,

After ages of trying to get .ST files back to floppy I've write a quick prog to get them from a ST HD back to floppy (only limitation is that the Beta version needs around 1.5 meg of RAM to run on a ST). It will also convert discs into .ST files :-)

Anyway, Any you people in Atari land know where I can hack some of those .MSA files ? I assume there are images of some kind also ? While I'm adding the .ST code I mayaswell add .MSA code also (if its just a image ?)

Message-ID: <1dr6t14.1f2wfqax8lhg0N@max04-001.enterprise.net>
Source record: 79593

I've just descovered Bad Mood !

Doom on the Falcon, at last!! But it's very slow tbh, sometimes dropping
below one frame per second (oh well!), but it's cool :-)

Is development of Bad Mood continuing?
Am I running the latest versions?
And finally is there an official Bad Mood web site(s)?

Actually, I'd be very interested to see what frame rates other Falcon
owners are getting, esp those with upgraded cpu's and DSPs.
I'm running it on a standard 14mb Falcon..

I'm hooked! :)

2027. Neodesk 3 INF files

Newsgroup: comp.sys.atari.st
Date: 1999-05-02 00:00:00 UTC
From: tconrardy@hotmail.com
Message-ID: <7gi7s2$262$1@news.ncal.verio.com>
Source record: 79600

Hello All:

Is there a way to save different .INF desktop files in Neodesk 3 for the same res?

You can do it with the regular TT/STe desktop.(Renaming Newdesk.INF to whatever you want. Example:Music.INF and LOAD INF file from the desktop. There must be a way to do it on Neodesk!

I am using a TT030 with the TTM195 monitor at 1280x960 res. Sometimes I create a cool looking pattern for my desktop, but must erase the old one before proceeding. It would be nice to save these with a different INF file, so I can create a desktop with my Midi apps, one for DTP, one for GAMES, etc.

Any info would be great.

Thanx

There is a utility that works quite well called ST2DISK available on
most Atari FTP sites. It is a TTP application. You drag the .ST file
to it and it writes it to a 720K disc.

I think it is available on most ST emulator sites as well.

There is another utility that does .MSA files also.

Let me know if you need any help locating the files.

Use a boot manager like XBoot to handle different NeoDesk DEFAULT.INF files. You can create a library of them and have XBoot copy and rename the one needed during boot-up.

It's been a while since I used NeoDesk: I don't remember if you can simply rename and reload during the same session. In any case, NeoDesk keeps its desktop file (DEFAULT.INF) in the main NeoDesk folder.

Because of palette problems with the NOVA card, I was forced to use two different DEFAULT.INF files, depending on what video mode was to be used for that session. I kept two files in the main NeoDesk folder: NEO_8.INF and NEO_15.INF; XBoot would take one of these and copy it to DEFAULT.INF. Both files were exactly the same except the palette information was different (in your case, this could be applied to using a different background image).

Sounds like a STinG problem then.

Something isn't right, either a path problem or a corrupt file somewhere. It might be an idea to take a copy of your settings from your Falcon stuff, delete everything and start again with a freshly-unpacked set of files, checking things like path settings in INFs etc etc.

Final straw-clutch (again apologies if you've tried these already) before trying that would be to check that you have actually got STinG loaded - you do have STING.PRG in your AUTOEXEC.BAT? If not it won't get loaded in MPC - an entry in the batch file is essential. Also, is it in the right place, ie after the HSM files and before MAGICSCR.PRG (which should be last)?

FWIW, this afternoon I tried deleting CACHE.DNS and suddenly all is well with STinG, at least with CAB - similar performance to Vassilis'. What I don't understand is that the reason I didn't try this before and assumed a general problem was that Iconnect didn't work either... daft (haven't tried it since STinG started to work).

Hallo Ashley!

AS>for some reason I can't understand I can't get a reliable connection
AS>at a faster serial port speed than this

very strange, indeed. I'm on 57k6 with both of my Falcons, and no probs. Did you check the settings of scc.prg in your auto folder? Receive buffer should be set to 2048 or larger. And, naturaly, drvin.prg has to be executed first, followed by scc.prg.

Source record: 79614

Hi, Ronald,

Let me see if I can pull some of this together.

(1) Rebooting to change ISPs

At the moment I have the following potentially ISP specific variables
in DEFAULT.CFG

MSS
RCV_WND

HOSTNAME
NAMESERVER
DOMAIN

and client stuff

E_MAIL
SMTP_HOST
HTTP_PROXY

With regard to the HOSTNAME group, you say that anything in the
example files should be left there. However I assume that since the
dialler configuration allows them to be included in DIAL.SCR, the
entries in DEFAULT.CFG are irrelevant, if the variables are included
in DIAL.SCR. Is this correct?

Since the client things are optional, I assume that they may simply be
moved to DIAL.SCR. Is this ok?

That leaves MSS and RCV_WND. If I wish to use the one DEFAULT.CFG I
can't tailor them to both ISPs. Or can I put MSS and RCV_WND in the
DIAL.SCR as well?

Leaving that for the moment, I currently set MTU in DIAL.SCR. I
started by following Peter's guidance that 576 is 'safe'. I have
discovered that even when MTU is set to 576 in my Dynamite DIAL.SCR,
the negotiated MTU shown by STinG PORTS CPX is 1,500. This leads me to
suspect that the MTU setting isn't having much effect.

Am I correct in believing that the STinG PORTS CPX shows the result of
negotiation while the STinG PROTOCOLS CPX does not? I don't think I
have ever saved anything under PROTOCOLS, but the CPX reports the
values in DEFAULT.CFG i.e MSS = 2000 etc.

(Please ignore my comment about MSS = 273. I haven't been able to
reproduce it. I can only assume that, in addition to using an old

PORTS CPX I had an old PROTOCOLS CPX on one of the computers.)

I suppose that my principal question is "Can I set MSS and RCV_WND in the DIAL.SCR?"

Source record: 79616

Hallo Ronald!

RA>The first means that you have missed installing the HSModem module
RA>MIDI.PRG, and that explains the rest of your problems described below.

well, actualy MIDI.PRG _is_ in the auto folder, after drvin, of course, and receive buffer set to 32768. In SERIAL.CPX, the midi port is visible and configurable. HSMINF10 says that it has BIOS number 1.

RA>The dialer will never offer "Midi" as an alternative for modem dialup,
RA>as the "Midi" port is not able to control a modem.

Tell this to my falcon number two. It is just sitting there in front of me, the dialer's miscellaneous dialog open and showing _Modem 2_, _LAN_ and _Midi_ in the Serial Port popup. On this machine, midi also is available in the sting port setup cpx.

RA>It lacks the extra I/O lines needed, and the voltage levels are
RA>completely wrong.

That's right, but that doesn't prevent this dialer from using it. Dialer Version 01.16, STinG Version 01.20. The latest ones, as on all three computers.

On both Falcons, DRVIN.PRG, SCC.PRG and MIDI.PRG are entirely identical. On both machines, the BS is MagiC 5.13. The only difference is in memory (number one with 14MB ST-RAM, number two with 4+8MB on a Magnum card), and in screen resolution enhacement hardware (screen wonder vs. screen blaster).

RA>One does _not_ use the dialer to 'connect' to other machines on the
RA>LAN.

You normaly don't, thats right. But nobody prevents you from doing so, and Falcon number one connects to the Milan (via Modem2 port) with either clicking "active" in the port cpx or chosing "connect" in the dialer. Where the dial.scr is set to "success-direct", of course.

RA>For this you must install the HSModem module MIDI.PRG, and it must
RA>start last of the HSModem modules.

All of these items were all right. But I found one little mistake: MIDI.PRG was sitting _after_ STING.PRG in the auto folder on Falcon one.
[MOMPL... resort... reboot #1...]

Oh, hurray! That was it! Now both Falcons show up with midi present in the STinG dialogs :-)

Well, but it doesn't work properly yet :-(
PINGing one Falcon from the other, many packets are lost or even never arrive.

Seems that they are stuck in the receive buffers of HSMODEM or wherever. I'll have to check that another day.

At least, both Falcons can see another now. So, the rest is hopefully just some finetuning :-)

RA>Still, you could try connecting the modem to one of the Falcons
RA>instead. Since they use MagiC that might work better.

It surely does. But, on the other hand, the Falcons won't allow me to use 115k2 on the serial lines. It happens to have too many errors then. So, the Milan is the better joice in that respect. I occasionally have 10000cps downloading html documents in CAB, even with normal 28k8 connects.

So, that's all for today.
Thank you very much for all your help!

It is possible but you'll need to add an FPU board which plugs in the
expansion slot and includes a 68881 FPU running at 16MHz. I think I still
have one in the loft so maybe be able to sell you one if really need one.

What apps are you hoping will benefit from the FPU?

Hi All,

I've a little problem connecting a Zip drive to my HD. I'm using an STe with a Link2 connected to my HD with HD driver v6. This works perfect until I try and add the Zip drive. No matter how I connect it or set the termination on the Zip it just won't read anything off the disks. Some ways it's sees the drive but doesn't read the disk, other ways it sees nothing all.

We recently had the same problem at our club meeting trying to get a Zip to run with an STe using HD driver v7.5 despite altering termination on Zip and HD (with expert help from Chris Crosskeys :-)) it just wouldn't go.

This is very weird as I've had my Zip connected up to my old Power Computing HD (with ICD interface) using the Link no problem at all.

Anybody any ideas?

Chris

My STinG installation was and is succesful, but it did take a lot of
effort. Could not someone make a STinG-"Light" or "Junior" that only
has that single purpose: to connect the simple Atari user to the
internet in less than 15 minutes ? I don't need all the other stuff..

>driver.
>

Hi

I've tried every configuration I can think of:(

This is how I first tried it, with and without termination!

Link II - EZ Drive - CD 1 - CD 2 - CD 3 - HD - MO

At the moment I'm using this set up:

Link II - HD - MO

I sold the PD drive because I couldn't get it to work:(

I've done everything I can think of, including the device config. I
doesn't even recognise it in the ID check. Saying that, one of my CD
Changers doesn't show up but Extendos has no problem with it!!!

The only think I am not able to test and that's a different adaptor,
I've checked with 3 ICD Link II's. I've also tested it on different
machines: 2 x STE's, 2 STFM's and 1 x Mega STE, and I get the same
result!!!

What I don't understand is why under ICD's driver it's detected but
under HD Driver it's not!!!! All I need the MO for is to transfer data
from my Atari's to my pc's for plonking on CD!!!

Any help is very appreciated, I think I only have a handful of hair
left;)

>
>Anybody any ideas?

Check your cables! I had this problem and I had ruled out the cables, I
had replaced one set of cables with another dud one. I didn't realise
until I got another device with another cable.

If that doesn't work, go systematically through your SCSI chain. Start
with just the zip drive and add other devices as you go, Some devices
just don't like the position they are given!!!

Double check your device ID's as well, I have a sticker on the front of
mine so I KNOW what their ID's are without having to struggle to find
them!

>It has come to my attention that several people, including myself are
>having problems connecting to the Freeserve ISP using STinG :-(
No problems here, I collect newsgroups just prior to 0800 and STinG reports
a successful link negotiation within a couple of seconds.

>I am using Roy Goring's scripts from his web page, but the scripts on
>the cover disk of AC#13 fare no better :-(
The script published on that reader disk is to all intents and purposes
identical to the one that it was copied from, with the exception that I have
cut the info about the http: proxy and port number from the default.cfg and
pasted it into my dial.scr (network environment section).

The only other point is the one that I mentioned in another article in reply
to Ronald - you should really add the line DIAL_SCRIPT to the end of the
published script, there is no need to actually have any scripting!!!

There's another tweak that you can make to the script (if you have the
latest release of STinG) by removing the nameserver entries and having STinG
negotiate them for you. I rather doubt that either this or my first point
would have any influence on these reported problems though.

>field.

Spot on <cuffs head>. I had removed that line from some of the scripts in a fit of tidying up - only a matter of luck that I'd stopped before chopping away at my main dial.scr!

This has an unfortunate knock-on. Anyone still struggling with the Freeserve dial.scr written by me and published on the reader disk of the latest issue of Atari Computing is advised to add the line:

DIAL_SCRIPT

to the end of the published script as per your advice.

To cut to the chase - all my scripts now load in correctly with that line added. Again, thanks.

>>I'm assuming that CAB is able
>>to pick up the necessary proxy from the dialer as naturally enough clicking

>It doesn't work that way. CAB doesn't know that STinG dialers exist
>(and under STiK or I-connect they don't). I think CAB asks CAB.OVL
>to get the addresses for it, and CAB.OVL uses the 'getvstr' function
>to ask the STinG (or STiK) kernel what values the variables have.

[...]

If I read you right then we're on the same wavelength - and with no need to clear inappropriate settings from the "Proxys" menu. I can't help wondering what the purpose of this section is in that case!

>>but I'd like to see it working here nonetheless, and at least you've set my
>>mind to rest that it should work.
>
>It shall indeed, and I am certain that it will for you too. We must only

The Atari ST Quick FAQ can be found at http://quickfaq.atari.org

It should give you the basic idea, but doesn't go too deep inside the
hardware architecture, the ST's hardware is not that complicated: a 68K,
supported by several specialized chips (MMU, Blitter, GLU, Yamaha sound
chip, floppy controller, etc...).

I think I've got the same version.. hope there's a new one sometime
soon, I'll check out the web site tonight.

> This is where I've looked for updates. Its Johan Klockars home page.
> He has written some neat software, although isn't the man directly
> responsible for Bad Mood (BM is a team effort). Download MGIF v5

Will do :-)

> Its really hard to judge frame rate sometimes. Bad Mood -looks- nicer
> that ANY PC version of Doom or Doom][I've ever seen, but the frame
> rate never has gone much above 10-12 fps for me on my 14MB Falcon
> with 32Mhz 68030 (PowerUp2 accelerator)...

Nice frame rate, esp considering this is a cpu upgrade only. (er, no
offense intended). I'll get Dale to have a look at Bad Mood - he's got a
Nemesis upgrade (lucky s*d!), so it should be as good as the real thing!
:)

btw, I've had mine upto around 4/5fps, but it can often drop to around
0.2fps in some areas! :-}
I've also downloaded some other Doom engine utils too, can't remember
most of the names (but one's called DEE). Anyway, one of these is pretty
cool and you can actually play Doom like you would on a real PC/Mac!
It's slower than Bad Mood, but at least all the monsters move and you
can fire your weapon...
I've also got the midi/sound file, but my Falcon is obviously too slow
as it sounds terrible - all crackly and noisy :(

Also(!) downloaded two other games - Running and Kart - neither works!
(they sounded sooo cool too!)

One last thing (g), is there a util that can configure the ram of a
Falcon to 4mb? I've got a 14mb Falcon you see, and I'm told this itself
can cause problems - like the older 4mb ST's did.

Anyway, I'm off :) Thanks for replying.

Oops! Sorry I meant initialising, not formatting. If this is done on the
Mac then the Falcon can't read it, so it needs to be done on the Falcon
first.
I too never format drives, esp when they're as big as the ones on my
Macintosh :-)

Hey Uwe, guess you're sick of seeing these posts hey?! Chill ;-)

>Gordy.

With Micq the answer is no. Micq doesn't support direct TCP
communications and functions only with the UDP server interface. If
someone ever decides to write a GEM ICQ clone the use of icqlib would
probably be a good plan, since it already supports TCP communications.

So... with micq. MSG yes, chat no. Unless I missed something in
the code ;)

>nothing all.

I got a ZIP on my 1040STfm as the main drive. Workee fine. HD-Driver is
great! I think mine is v7.1 or some such; it isn't the latest.

Don't forget that the ZIP doesn't supply Term Power, which the Link2 runs
on. You probably have this covered, but if not, and for general info, there
are various solutions to this including a kludge cable running from a
joystick port to the SCSI port on the ZIP. My personal solution is to have
a CD-ROM drive upstream from the ZIP; the CD-ROM's Term Power runs through
the ZIP and powers the Link2.

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.20 for the first game and $1.10 for each additional game. Shipping for hardware and accessories depends on the distance that the order must travel. Foreign orders welcome.

Large orders will be weighed as a package, to reduce shipping costs.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very

rarely sell items that aren't working, but if I do, they are
clearly labeled as such.

3) Trade offers, in particular for items that I need, will be
considered (especially if the trade offer overwhelms me). I
collect for over 50 different systems, so please feel free
to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping
costs. Shipping cost depends on both the weight of the order
and the distance that the order must travel, unless a set
amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't
serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly
listed. There is no minimum order.

7) If you have a problem with the listed price, please remember
that nobody is forcing you to buy from me. I have been in
business since 09/05/93, so I have a good idea how to price
items. My personal philosophy is that something is only worth
what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order
-drawn from a U.S. bank branch-, or cash. Orders from outside
the U.S. are also accepted (also, please check out my want
lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your
order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in
(please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this
information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

Those are version 1.25 specs, yet HD-Driver reports itself as 1.30,
whose details remain unavailable. Where can I read the 1.30 specs?

Sure, it's by Patrice Mandin - it's none DSP though so it's very slow.

But you *can* play the game, but not very well on a bog standard Falcon!
I'm using v0.06 from November 28th 1998. This is pretty damn superb, and
I'm checking the docs in a mo to find out more information...

I can't remember where I got it from, I was at loads of Atari sites last
night you see (I new here!). Anyway, I could email it you?

btw, you sounded like you didn't believe me! :-\

For Sale:

1040 STe computer (internal floppy drive & power supply)
- 4 Mbyte RAM, TOS 1.6, mouse, manual, power cable, original box -$75.00

two - SM124 monitor - manual and original box - $40.00 each

Quantum P52S hard drive (52 Mbyte SCSI) with Supra host adapter & power supply
- comes with Supra software and manual, DMA cable, 2 drive SCSI cable, power cable, installed in shoebox case that will hold two hard drives
- included software installed on drive: Quick ST II, Warp 9, Diamond Back II, Universal Item Selector, Hot Wire, Ultimate Virus Killer, MaxiFile III, Diamond
Edge + original disks + manuals for all programs except Warp 9 - $75.00

two - SF314 disk drive - manual, cables, original box - $25.00 each

two - Practical Solutions monitor master - $10.00 each

All items are in great working condition and cosmetically clean and in good shape.

See something you would like to have, but don't like my price. Make me an offer, I might take it.

Terms: Continental US addresses only please. Buyer pays shipping.

Please reply via e-mail to: gwestndrf@aol.com

Oooops!
I'm afraid I described how it _should_ work rather than how it _does_ work.
Still, it does no harm to have it available in the dialog.

----- snip ----- re: more Midi problems already fixed

>On both machines, the BS is MagiC 5.13. The only difference is in memory
>(number one with 14MB ST-RAM, number two with 4+8MB on a Magnum card), and

None of those things should matter at all. (Unless bugged.)

>RA>One does _not_ use the dialer to 'connect' to other machines on the
>RA>LAN.
>
>You normaly don't, thats right. But nobody prevents you from doing so, and

>is set to "success-direct", of course.

Ok, if you insist on doing it the hard way you may of course do so.
But getting a SLIP connection this way does _not_ test that the other end
is able to communicate, as you seemed to expect it to. That kind of test
and negotiation is only done for PPP, and at present STinG does not work
as a PPP host (Like an ISP does).

>RA>For this you must install the HSModem module MIDI.PRG, and it must
>RA>start last of the HSModem modules.
>
>All of these items were all right. But I found one little mistake: MIDI.PRG was

Ok then, I knew it had to be something involving the HSModem boot order.

>Well, but it doesn't work properly yet :-(
>PINGing one Falcon from the other, many packets are lost or even never arrive.
>Seems that they are stuck in the receive buffers of HSMODEM or wherever. I'll
>have to check that another day.

That problem is entirely due to the fact that no handshake lines exist for the Midi port, so you have to rely entirely on TCP flow control instead. For that to work properly you _must_ raise the reception buffer size to be at least the same size as the TCP reception window (RCV_WND). Preferably it should be even higher, since several TCP connections can be open at the same time.

I use 16384 (16KB) for reception buffers, and 4096 (4KB) for transmit buffers. This has worked fine for me on all kinds of machines (ST, STe, Falcon, TT).

>At least, both Falcons can see another now. So, the rest is hopefully just some
>finetuning :-)

It should be.

>RA>Still, you could try connecting the modem to one of the Falcons
>RA>instead. Since they use MagiC that might work better.
>
>It surely does. But, on the other hand, the Falcons won't allow me to use

>Milan is the better joice in that respect.

True. An unaccelerated Falcon is not a very fast machine. In fact the use one normally makes of Videl to get higher resolution often lowers effective CPU speed to the same level as an 8MHz ST, or even lower. But with a good accelerator equipped with FastRAM, the response changes drastically.

>I occasionally have 10000cps downloading html
>documents in CAB, even with normal 28k8 connects.

Yes, for pure text (like HTML) compression can reach impressive factors.

>So, that's all for today.
>Thank you very much for all your help!

You're welcome, and good luck!

> Parity generator using a 74HC280 chip. It would be nice to see any
> further detail before I have a go at it. This particular article
> recommends fitting the chip on the hard drive. Has anyone done this?

Yes, I have. The circuit you refer to may even be based on my original
design, which I later gave Martin Graiter permission to spread in a
modified version accompanied with his own instructions. Others nay have
carried on from there too of course, or even designed similar stuff of
their own. (It is a rather basic need for host adapters that lack it.)

> I would have preferred to fit it on the host adapter if possible,
> otherwise in future when changing hard drives it could mean more
> modifications to each one.

I agree completely. In fact I have myself only installed it on host
adapters, not on any drives.

Is there anything else you need to know about this ?

There seems to be a great variation in how effective it is on different
Falcons, and unfortunately there is no patch which gives 100% performance.

>The faster the driver, the more important it is to fix the Falcon
>SCSI/DMA hardware.

Agreed, but it would still be nice if HDDriver could recover from such an
error more quickly. On my own Falcon these problems used to be very common
despite the 'clockpatch', and remained so until I installed the Centek CT2B
accelerator recently. Each time the SCSI bus 'froze' it would take appx.
three minutes for HDDriver to recover and reset the bus. That is too long !

>has that single purpose: to connect the simple Atari user to the
>internet in less than 15 minutes ? I don't need all the other stuff..

Yes, it would be possible to construct a limited package based on the
STinG components, eliminating some of them and with simplified docs.
But those involved in developing STinG for its real purposes do not
have time to spare for constructing such a 'light' release package.

Also, I would not feel right about releasing STinG in any form that
is so different from how Peter Rottengatter prepared earlier ones.
I would need to have such a decision confirmed by him personally.

I am, after all, only carrying on the STinG support in his absence,
and am therefore limited in my choices to the things I know that he
planned or at least approved of. Alternative STinG releases is one of
the things I know that he disapproved of, so I will not make any such.
(Unless he tells me differently of course.)

It might be that CAB doesn't bother to 'ask' CAB.OVL, except when you do
click those dialog fields. It would then assume that the incorrect settings
are still valid, even though you have changed them in some script. Thus,
the dialog serves as a means to force CAB to 'swallow' those changes.

Hi Jim!

Best thing to do is to get a Falcon screen saver. I personally use Turboblanker. It does the screen saving well, under MagiC too. It doesn't produce any pretty displays, because it actually turns off the Falcon's screen updates, which actually accelerates the system by about 10% I think.

If you want a screensaver that produces pretty screen displays, see if you can get Twilight. This produces fine displays of true colour pictures. It's commercial, though it can be hard to find. There was a demo version on a magazine cover disk a few years ago, and I've heard of people getting hold of the full version even now. There was a copy on sale at the recent Atari Show in the UK, but I missed out on buying it.

Cheers!

James

Hi Chris!

I too had the same problem with my Zip, when I ran from an ST. Now I have a Falcon which has better SCSI (SCSI 2 as opposed to SCSI 1 on an ST).

I couldn't get it to work at all, until I put the Zip first in the chain. My chain was as follows: ST, then Zip (id 5, termination off) then HD (id 0).

When I upgraded to my Falcon, I had some problems with termination, but getting the internal terminators removed from my HDs and using an external terminator solved that problem.

Cheers!

>(they sounded sooo cool too!)

Kart doesn't work on my machine neither, but Running does! I'm told that
the shareware version can cause problems, but the full version doesn't.

You can get the full version from CyberSTrider,

http://www.cyberstrider.org/

>One last thing (g), is there a util that can configure the ram of a
>Falcon to 4mb? I've got a 14mb Falcon you see, and I'm told this itself
>can cause problems - like the older 4mb ST's did.

There are utils that can do this, but I've never seen the need to do it,
and have never heard of anyone else needing to do it.

Cheers!

2082. Millenium 2.2 on Falcon

Newsgroup: comp.sys.atari.st
Date: 1999-05-03 00:00:00 UTC
From: jfhaslam@zetnet.co.uk
Message-ID: <372e07a0$0$489@news.zetnet.co.uk>
Source record: 79531

Hi all!

Has anyone out there managed to get the game Millenium 2.2 to run on a Falcon, under Backwards or otherwise?

I have three copies of this game, my original was corrupt years ago, but recently I bought two further copies of this game.

BOTH of the new (well second-hand) copies report "Data on Drive A is damaged" on Disk One, which makes me wonder whether they are damaged?

I haven't got an ST anymore, so I can't test it on one.

Cheers!

When you say DMA do you mean Background DMA under HD Driver?

>Finally, HD Driver is not likely the problem, other than it is FAST, and
>the bus on your falcon can't keep up ;) MagiC seems to speed my falcon
>up a bit as well..and with DMA turned on....well...the Falcon's SCSI bus
>just can't keep up!

I used to use ICD too, but since getting HD Driver and MagiC, I won't EVER
go back to ICD.

>Disable DMA and give it another run.
>Make sure the SCSI bus is well termintated...

I'll say this to Paul: don't give up, definately disable Background DMA, I
think you need a more powerful machine than a Falcon to use it without
problems. HD Driver is THE hard disk driver, ICD is just not supported any
more, whereas HD Driver gets upgraded quite regularly.

Cheers!

2084. Tempo has a FREE phonecalls ISP

Newsgroup: comp.sys.atari.st
Date: 1999-05-03 00:00:00 UTC
From: jfhaslam@zetnet.co.uk
Message-ID: <372e07a6$0$489@news.zetnet.co.uk>
Source record: 79533

Hi all!

In the UK a new free ISP has started up. It offers FREE access and FREE phone calls (for the Net only not normal calls!) after 6pm during the week.

Its being offered by the Tempo chain of electrical stores, who are giving out CD-Roms with the PC and MAC software on it.

Does anyone know if this service could be used on an Atari, just like with Freeserve can be after the registration has been done on a PC??

This ISP should revolutionise the ISP market in the UK, and at long last we will be able to compete with the North Americans, who have had free local calls for years now.

Cheers!

Me too! :)

>I was wondering what Atari terms programs support ANSI (besides Freeze
>Dried Term) and if any supported RIP term?

I've never seen any RIP-Term programs on an Atari, but there are two good ANSI terminals around, but which one you use depends on which Atari you use.

If you have a screen res of 640x480 or larger in 16 or more colours, such as on a Falcon, then I suggest getting hold of Connect. It used to be commercial, but is now freeware, with the key generator released.

If you've only an ST then I suggest getting ANSIterm. This runs in ST Low res, but with a special half size font that gives 80 columns, thus giving full colour displays.

I have both of these programs, and can email you them, if you need to.

Cheers!

Ronald,

I think I have solved the problem with the MSTe.

I had told you that, after I installed the correct STinG PORT CPX,
Alphalink (MTU = 576) seemed fairly good but Dynamite (MTU = 1500)
was, if anything, worse.

I went back again to your check-list of things to try. The setting,
and the only setting, which makes any apparent difference is DELAY.
The MSTe appears to be comfortable with DELAY = 10 if MTU = 576 but
needs DELAY = 15 (20 might be even better) if MTU = 1,500.

Does this make sense?

Anyway thanks again for your patience and assistance. I have learnt a
lot more about STinG configuration variables from the exercise.

By the way - there are some advantages from rebooting to change ISPs.
I can set up default congiguration files for clients during booting.
Whether this advatnage outweighs having to reboot is another matter.

>search for the smallest or the largest possible match?

I think he is OK in Everest as this matches each angle bracket
separately AFAIK. I have just done a mammoth conversion of my WDIALOG
HTML translation to plain text for the MagiC programmers' documentation
and simply merged all *.HTMs in the correct order and then did a global
Search for: <*> Replace with: (nothing) and it worked fine.

I have also discovered a useful shortcut to Everest's Replace function
that is not covered in the docs. The 'Search for:' line works just like
'Search selection...' or ^I: If you drag out a block of the words you
want to search for (MUST all be on one line) then they will be entered
automatically on the 'Search for:' line and you only have to type in the
replacement line. HTH someone. It's specially useful with foreign words
that are easy to mis-spell!

AFAIK Millenium is TOS version dependent. On my ST's it only runs under
TOS 1.04, but not under TOS 2.06, so I doubt very much if it can run
under TOS 4.0x which is what Falcon uses. It probably is not adapted
to run on a 68030 at all either, so I'm afraid there's little chance.

It certainly doesn't work for me, even thouth the same diskette does
work under TOS 1.04 on an ST.

The followup to Millenium, Deuteros, does work on the Falcon though.
Just remember to save fairly frequently, because the old mouse bug
from Millenium is still there, occasionally locking the mouse pointer
in a useless part of the screen, so you have to reset the system.

The funny thing is that I have seen a so-called Falcon-adapted version
of Deuteros, even though the one I had for ST works fine on the Falcon
without any adaption.

>> below one frame per second (oh well!), but it's cool :-)

Well, nowadays you can find the real DOOM (since the sources were
released), but that's of course very slow.
(If you _really_ look for it you might even find AtariQuake, but that's
slow even on an '040, unfortunately.)

>> Is development of Bad Mood continuing?

Well, it's not officially dead, but the mailing list has been very quiet
for a long time now. Douglas Little (of APEX etc) wrote much of the code
and he's been busy with other things lately.

Recently someone mentioned that the work had supposedly been taken up
again by some people, but for some reason they don't say anything about
whatever might be happening on the mailing list.

>> Am I running the latest versions?

The latest should be 3.07, binaries of which can be found on my WWW site.
I should of course have the sources there as well, but have never gotten
around to uploading anything after the 3.03 ones.

>2 years old now, which isn't that new really...

I think it's 'only' about a year and a half, actually. ;-)

>> And finally is there an official Bad Mood web site(s)?
>
>http://rand.thn.htu.se/
>
>This is where I've looked for updates. Its Johan Klockars home page.

That would be me, and yes it is the 'official' site. The mailing list is
running on the same machine (and the site has an archive of all the
messages ever sent on that (well, I don't think I've kept up with that
either, but I do have the archives, somewhere) and some other related

things).

>He has written some neat software, although isn't the man directly

Thanks.

>responsible for Bad Mood (BM is a team effort). Download MGIF v5

I was one of the three people who got it started and I did some of the
initial work. That was a long time ago, though...

>as well as Bad Mood...you'll be impressed...

:-)

My main other programs are QLem (a Sinclair QL emulator for ST/Falcon)
and fVDI, but on the ftp site (same address) you'll also find the latest
released versions of XaAES (declared dead by its originator, but I didn't
agree with that).

>Its really hard to judge frame rate sometimes. Bad Mood -looks- nicer
>that ANY PC version of Doom or Doom][I've ever seen, but the frame

That's mainly because it uses a 16 bit graphics mode rather than 8 bit
like in the original.

>rate never has gone much above 10-12 fps for me on my 14MB Falcon
>with 32Mhz 68030 (PowerUp2 accelerator)...

On a Falcon+AB040 (but with standard DSP clocking) it mostly stays
around 10-15 fps, IIRC.

2092. Re: STunG!

Newsgroup: comp.sys.atari.st
Date: 1999-05-03 00:00:00 UTC
From: ab616@chebucto.ns.ca
Message-ID: <7gld5s$j8m$1@News.Dal.Ca>
Source record: 79541

Okay...an update on my progress!

I have DRVIN, MFP_FALC and SCC in that order in my Auto folder.

Upon booting, I start STinG and watch the modules load in a line.

I go to STinG Port settings in the Control Panels, select Centronics, scroll down to Modem 2, double click on Modem 2 (which brings up my saved settings of MTU=1006 (as per my ISP), 0.0.0.0 for IP settings and Active box selected.)

I go to STinG Internals in the Control Panels and ensure the Active box is selected. If I don't do these Control Panel settings, the Dialer reports 'STinG not active' and refuses to proceed further).

I start the Dialer and it connects (successfully it says) at 14,400 bps (the top speed of my modem) and using the settings and dial script provided by ISP (MSS=956, RWIN=3824 as per ISP).

LOGIN.BAT is activated as per the script and the message 'success' is displayed. My ISP has confirmed that I am making the proper connection and am online via PPP.

Starting CAB (using the ovl obtained from Dan's site), I get the message: can't resolve hostname.

Leaving CAB (after it unlocks - about 30 seconds later - sometimes disconnecting me and hanging up the modem), I start Telnet. Telnet renders the message: DNS query - can't resolve hostname. I either quit Telnet (if given the chance or am disconnected via a lockup).

Several times I have received an 8 or 9 bomb crash.

I am running a Falcon 030, with 4 mb ram, no NVDI or special tricks.

Any further help appreciated!

Tony

> availble in b/w?! Is there any list available?

That would be interesting, as alot of them have high quality when it comes to gameplay. There were both commerical and shareware games, and one of my alltime favourite was Gilgalad, a shareware arcade game by Markus Dheus, which was difficult to control (so none of my friends liked it), but I still like to play this!

BTW, all of the Sierra games run on b/w as well, AFAIK...

If you tell me what your problem is, I will certainly try to help you.

Didn't the installation work? Don't you know how to get mail and news
from your host? You need other programs for that.

If you give me more specifics, I'm sure we can find a solution.

Probably. If you can use your internal modem with other ATARI comms
programs, then maybe you'll have to wait for the next STinG release.
(at least the Dialer part).

I do most of my reading/posting offline, because the few times that I'll forget and make a reply to a post while online, I'll end up with a blank screen and a locked up TT. But last friday I forgot and replyed online and it was sent out ok, no lock up at all.

Strange! and no i didn't get a new keyboard, i found out that the right arrow key works in everest, but it sure slows me down. Still hope to find a mega st(e)? keyboard.

Well, I can point you to the right homepages anyway, since I do not store
either of those files on my own site.

Olivier's homepage is: "http://services.worldnet.net/vcf-com/olivier.htm"
Dan's homepage is: "http://www.netset.com/~baldrick/"

> Your website is extremely unfriendly to my ST using Flash 1.60 and Lynx.

What is Flash 1.60, yet another TCP/IP stack ?!?

What Lynx version are you talking about ?

For Atari machines I only know about Lynx under Linux or MiNTnet,
but I haven't used either of them. (No need to, having CAB.)

>I select an option on your list and just gat the same list over and again.

That probably has something to do with some lack in your browser.
I have tested the page with a frameless and graphicless browser,
and it seemed to work fine for me. I don't know what more to do.

>(1) Rebooting to change ISPs

Stop doing that, it is not needed.

>At the moment I have the following potentially ISP specific variables
>in DEFAULT.CFG
>
> MSS
> RCV_WND

Set MSS to match the highest value that either of your ISPs allows, which
in your case should be 1460. Set RCV_WND to some value larger than 3000
but smaller than 32767. Tweak it as needed in that range to improve
performance. Both values are REQUIRED even if you never dial.

----- snip ----- re: the other ISP dependent variables

You may remove these, but then some offline clients may get unhappy.
I'd rather use the values of my preferred ISP as defaults, but that is
up to you.

>With regard to the HOSTNAME group, you say that anything in the
>example files should be left there. However I assume that since the
>dialler configuration allows them to be included in DIAL.SCR, the
>entries in DEFAULT.CFG are irrelevant, if the variables are included
>in DIAL.SCR. Is this correct?

In relation to online clients yes, but not in relation to offline clients.
They may still need to find such stuff.

>Since the client things are optional, I assume that they may simply be
>moved to DIAL.SCR. Is this ok?

Sure, but again, if any offline clients need them you will need duplicates
in DEFAULT.CFG as well, or avoid using any such clients until you have been
connected. The variables from DIAL.SCR will naturally remain even after
you disconnect the modem.

>That leaves MSS and RCV_WND. If I wish to use the one DEFAULT.CFG I
>can't tailor them to both ISPs. Or can I put MSS and RCV_WND in the
>DIAL.SCR as well?

As I have said several times now:

MSS will adapt _downwards_ in size automagically, so as not to exceed the maximum MSS that can fit inside the current MTU, at any given time. When that happens, RCV_WND does not need to change similarily, because it is allowed to be a large multiple of MSS.

You may, if you wish, add MSS and RCV_WND into DIAL.SCR, but you should NOT remove them from DEFAULT.CFG. Also, if you do add them into a DIAL.SCR, you should do it in the environment section, and nowhere else. Note that there is absolutely no reason to add either of them to DIAL.SCR.
(or any alternative dialer script)

>Leaving that for the moment, I currently set MTU in DIAL.SCR. I
>started by following Peter's guidance that 576 is 'safe'. I have
>discovered that even when MTU is set to 576 in my Dynamite DIAL.SCR,
>the negotiated MTU shown by STinG PORTS CPX is 1,500. This leads me to
>suspect that the MTU setting isn't having much effect.

That is entirely due to the PPP login method. A value derived from those negotiations has a higher validity than a default value and will therefore replace it. But MSS is not negotiated this way, and will adapt downwards only, to current MTU, which is why it must be set at the highest MSS that either of your ISPs allow.

>Am I correct in believing that the STinG PORTS CPX shows the result of
>negotiation while the STinG PROTOCOLS CPX does not?

That is only because only a few values are negotiated, notably MTU and dynamic IP addresses. The nameserver addresses are also in that group however, and should be reflected in the protocol CPX.

Naturally all of this negotiation is only possible with PPP login.

>I don't think I have ever saved anything under PROTOCOLS, but the CPX
>reports the values in DEFAULT.CFG i.e MSS = 2000 etc.

But if you had saved its values it would stop doing so, and would instead set the values that were active at the save. In initial state this CPX simply reflects the state of the variables that exist in the STinG kernel regardless of how they came into existence. When you save, however, its state changes, so it will henceforth set the saved values at each boot.
(You may even prefer to erase this CPX. Its use is optional.)

>(Please ignore my comment about MSS = 273. I haven't been able to
>reproduce it. I can only assume that, in addition to using an old
>PORTS CPX I had an old PROTOCOLS CPX on one of the computers.)

It would have to be very old indeed to show a false MSS, but ok.

>I suppose that my principal question is "Can I set MSS and RCV_WND in
>the DIAL.SCR?"

Yes, you may, but there is no real reason to do it.

Hi everyone,

The sad inefficiency of aFTP 1.51b under STiK/STinG has been the subject
of several posts lately, as a result of which I contacted Jan Krivanek
of ATACK team.

He responded very quickly and has now prepared a beta version that does
eliminate the upload problem. I got 4500 CPS when uploading at a bitrate
of 76800 BPS, which is a significant improvement over previous results.

I expect he will shortly upload a new release version to the ATACK
home page at "http://www.pwp.cz/atack"

From: mike.borsley@zetnet.co.uk
Message-ID: <372d45ed$0$492@news.zetnet.co.uk>
Source record: 79631

I noticed in AC 13 that Jo Even Skarstein's site
http://www.atari.nvg.ntnu.no/ had details of a hardware hack for internal
hostadapters that don't support parity described as :-

'Modifying the Atari hostadapters in the Mega STE and Stacy'

When I tried to download this info it kept coming up with error - file
not found. I wondered if anyone has this and could let me have a copy.

I did download from the same site a neat little circuit for an SCSI
Parity generator using a 74HC280 chip. It would be nice to see any
further detail before I have a go at it. This particular article
recommends fitting the chip on the hard drive. Has anyone done this?
I would have preferred to fit it on the host adapter if possible,
otherwise in future when changing hard drives it could mean more
modifications to each one.

Thanks in advance for your comments.

Cheers

My pages do not use either cookies or javascript. They do use
frames, and a few gif pictures, but not for a frameless
browser without graphics. This has been tested.

The complaint you made would mean that lynx can't follow simple
HTML links to my subpages, in which case that lynx version is
completely useless, and should have been replaced.

I don't get it. Can anyone else here see something wrong with my
pages that could cause this kind of problem ?

I think you should speak to your ISP about updating their Lynx, and/or
reconfiguring it properly. No matter what Olivier has on his page it
is not sensible for a text browser to overwrite text the way you just
described it. Evidently it can not identify links properly either,
since that also failed on my page.

> I did get through to the Dan's page, however. Works okay.

Ok, so then you should now have his CAB.OVL, and this does work with
STinG. Now if you can just configure STinG properly you should not
need to bother with Lynx anymore.

Did you actually activate the SCSI IDs of these devices in the Device
Configuration window? Also check your cables and especially your
termination. A lot of users have their SCSI chain not properly
terminated.
Since lots of users are using MO and PD drives with HDDRIVER (including
myself) you can be sure that this is not a general problem with the
driver.

Once more: Formatting is NEVER necessary since there is no difference at
all between media formatted on PC, Mac, Atari, Amiga, Unix or whatever.
The file systems are the only thing which is different and file systems
are created when partitioning, not when formatting. Formatting media
that have no bad sectors is nothing but a waste of time.

Hi Jos, PMFBI, but I spent a few hours on the phone with Rein last friday and saturday to get it basically to work.

He had Okami still set to UUCP-mode, but after that we found a few strange things. Rein decided to do all the finetuning later (expire.inf, sigs.inf etc) so we got to at least a basic working setup (except for Popwatch), and we had the sigwhen set to 2 (I seem to recall). Now everytime he hit the "send" button Okami bombed out on him. We tried to track down what the problem was, QED generates a *.tmp file in /tmp, after "send" this moves to /news/_o_outb as a file with a number and a file with the same number plus ext .hdr. After "export" these are renamed into *.wrk and *.txt and moved to /news/mqueue. The funny part was that after hitting "send" the *.tmp file was still in /tmp and meanwhile a new zerobyte *.tmp file was created there with number n+1. So instead of working 00000016.tmp to the new files in /news/_o_outb it bombed out, after that the 00000016.tmp was still in /tmp and a new 00000017.tmp had been created...

After some time Rein deactivated the sig addition, and then it went all fine. Could this be because of wrong info in sigs.inf? I think he was using the default one that came with the setup.

Anyway, after that it worked OK, except for that we didn't manage to actually send the mail out, it started but after some time reported "failed sending mail"... We checked/doubechecked/triplechecked all path settings, no probs. In the end we decided to completely reboot the system because of all the crashes before and the last test went OK. At least I got several test e-mails later from him. Don't know what the state is now, but I got puzzled about the crashes from Okami when we had the sig addition activated on the default sigs.inf...

You'll have difficulties finding a replacement floppy drive, but chances
are that the problems you are experiencing are from an aging drive
mechanism. You can replace it with a PC floppy drive, under certain
conditions that are described in the Quick FAQ.

> Thanks in advance for your time and help!

I don't see anything wrong with posting for sale ads in here, since
there is no more appropriate place. However, one thing that annows me is
people who post one ad for each item. The result is sometimes 10 posts
to download, when one list would have been enough. Oh, that and the
people who assume usenet is limited to their neighbourhood and forget to
say where in the worl they are located...

No, because I do run a LAN. But there is no default route to the modem
in the one I use.

When you go into the Port settings, the word Centronics is showing in
the box, which is why I used it to describe my location. I am not using
the Centronics but am scrolling down to Modem 2 where I double-click to
activate my saved settings. You missed the phrase 'scroll down to Modem
2'. If I had said I selected 'modem 2', some poeple would have said
'there is no such setting - only Centronics'.

Either that or he hasn't entered the new font information in the correct resolution (SCREEN.SYS) area while using ASSIGN.PRG. Or in the case of changing the system fonts, one must double-click in the left panel to change these fonts back to "normal" status, and then do the same to assign the new "system" fonts (which are prefaced with an "s"). Maciej may have missed these points.

The ones I know of which run in mono:

Ishar
Monkey Island
Oxyd
Various puzzle/patience games

There was a thread in here a while back where someone came up with an
enormous list; try a search on Dejanews for "mono games" or similar
keywords.

>would not make any sense (on a LAN) :-)

As Tony's said in his post, he was describing the method of operating the CPX. The key points are that he's using his serial port but has it set to active by the CPX: this will confuse the dialer and result in odd behaviour, including seeming to connect but not working - I know, I did this myself the first time I set up STinG!

>As I have already said in an other post: If you don't want to run a LAN
>simply delete STNGPORT.CPX and STING.PRT!

This may simplify things in one way, but the CPXs can actually be helpful while troubleshooting as you can see the state of things like whether the port is active or not. I've always had the CPXs installed and used STinG for a long time with no problems on my STE. You just have to have the settings right. In my case, though, I did most of my configuration with a text editor as I'd got used to doing it that way with STiK...

>To me his problems sounds like a DNS problem. He should first try to
>activate "Request Name Servers from remote" in DIALER.APP - Configs -
>Addressing. If this doesn't work adding the DNS address directly should
>get things going.

This won't be worth doing until the dialler works correctly.

>To test his connection he should first try to Ping his ISP with
>numerical address. If this works his connection is basicly working.

Sound advice.

Tony,

Three quick questions

(1) Is your name server set correctly?

(2) What is your default page in CAB? Is it trying to connect to
something which doesn't exist?

(3) Does your ISP insist on a proxy server? If it does and you do not
have it set, CAB will fail to resolve.

Not true!

Here, under MagiC with STinG, Dan's Overlay handles numerous concurrent
downloads in the background... all while retrieving News and Mail with
NEWSwatch and POPwatch, respectively, and continuing to view other pages
within Cab.

I don't have any idea what the problem is, but it is not *strictly* a
problem with the Overlay.

Hallo Ronald!

RA>But getting a SLIP connection this way does _not_ test that the other
RA>end is able to communicate, as you seemed to expect it to.

Sadly not:-(
But, doing it that way, the settings in the dial.scr will override the corresponding settings in the CPXs, and will show me at least the IP number the dialer believes he has got. That one isn't all right sometime, so I have an instant control for that.

I'm currently struggling with the proper setting for "subnet mask" in the masque section of sting port cpx.
The settings are as follows:
Milan is 192.0.255.1
Falcon #1 is 192.0.255.2
Falcon #2 is 192.0.255.3
Which IP should I use as subnet mask in the masquerade settings?
Currently it is 192.0.255.0, but that gives me trouble when connecting to my ISP. As long as masquerade is disabled, everything will work fine. As soon as it is enabled, the dialer will report got_ip=192.0.255._0_ on first login attempt, and no go. Disconnect/disable/enable/connect gives me a non responding modem, leaving and restarting dialer leads to a working connection.
Oh, just checked another thing: it seems that I had the stingport.cpx settings saved with masquerade activated. Possibly this was the reason for the connecting problems. Nevertheless, I'd like to know how this "subnet mask" works. Masque.hyp didn't help me :-(

RA>and at present STinG does not work as a PPP host

And why not? Is that so much different from working as a PPP client?

RA>For that to work properly you _must_ raise the reception buffer size
RA>to be at least the same size as the TCP reception window (RCV_WND).

I already did so prior to my PINGing experiment, set it to 32k or so.
Currently, none of the falcons is in operation, so I can't check right now.

Yesterday, I've been trying to connect the two Falcon's LAN ports, but that didn't work either. First, I had to solder a wire, and hopefully did it right.

In chips 'n chips hypertext by Michael Ruge I found the following pinout:

1 Output Handshake (DTR, RS422)
2 Input Handshake (TRXCA external clock)
3 Transmit Data -
4 Ground .-u-.

5 Receive Data - /8 7 6\
6 Transmit Data + |5 4 3|
7 Reserved \ 2 1 /
8 Receive Data + ^___^

So, I connected in the following way, using a 8-pin shielded cable:

connector
one two
1-----2
2-----1
3-----5
4-----4
5-----3
6-----8
7-----7
8-----6

Is this supposed to work, and if so, which settings should be done in the scc.prg? I tried it with starcall, but didn't see characters coming through correctly. Serial port settings (speed, 8n1) were identical, of course, and so were the settings in scc.prg.

>
>Does this make sense?

Yes, it does. I myself always use 20 for my Mega ST, even though it
does have a 16 MHz accelerator with cache (similar to MSTe). A low
delay increases the CPU load slightly, but increases the speed with
which STinG can respond to communication events. A compromise must
often be used, and for most machines using 16 MHz or less, that means
using a timeslice delay higher than 10.

I assume that the 15 ms timeslice works equally well with both ISPs.
Correct ?

>Anyway thanks again for your patience and assistance.

You're welcome.

>I have learnt a lot more about STinG configuration variables from the
>exercise.

That is a common benefit of such problems. One is forced to learn more
about how the stuff works than one would otherwise have done.

>By the way - there are some advantages from rebooting to change ISPs.
>I can set up default congiguration files for clients during booting.
>Whether this advatnage outweighs having to reboot is another matter.

Yes, I see what you mean. Ideally client APPs should allow multiple
accounts, mailboxes, etc, through other means than rebooting.

I think that we tracked the problem down to the CAB overlay. You need either
to have connected using IConnect and use the overlay as supplied with CAB,
or use Olivier Booklage's overlay. Dan's overlay doesn't appear to support
background downloading unless teamed up with STiK.

As usual this is IME...

Put CAF_FIX.PRG in your AUTO folder, this will reduce the timeout value.
Note, however, that if you have a very slow SCSI device connected to
your Falcon shorter timeouts mean that transfers of large amounts of
data in a single block will fail. This is because it's impossible to
decide if a transfer ist still running correctly or if the Falcon SCSI
bugs cause the delay. Unfortunately you can't solve most hardware
problems by software.

Not at all. Background DMA has nothing to do with having a powerful
machine or not. Regardless of your machine you always profit from the
fact that the machine doesn't completely block during DMA transfers.

This last bit is probably the cause of your problems: do NOT set the port to active in the port CPX, as it confuses the dialer (this point is mentioned in that step-by-step on my web site). The dialer activates the port when it needs to.

You DO need to set *STinG* to active in the Internals CPX or the dialer will complain as you describe.

It's strange that it bombed, because it should receive a signal and
then abort.

Are you sure you used the latest version? There was a bug there, with
the sig function: the program crashed if the output of the \pipe
program was empty. But I fixed that some time ago. I checked just now
if it works if aphorism.ttp is not present, but it does. I have set
sig.when=2 as well.

>We tried to track down what the
>problem was, QED generates a *.tmp file in /tmp, after "send" this moves

That one is for the output of the \pipe program (in this case:
aphorism.ttp).

>So instead of working 00000016.tmp to the

He must have used an older version of Okami, maybe one of the versions
I put out after the recovery from my harddisk crash, but not the
latest one. That's the only explanation I have at the moment.

I'm not using IConnect except for tests, but my little experience with
it says that if it gets connected and displays the small info form with
the timer, then you're really connected.
Have you tried to 'ping' any host ? Have you installed any IConnect
compatible CAB.OVL ? (there are two: CAB's original and Olivier's v 5.53)

Are you getting any messages from CAB ? (eg can't resolve host, network
down etc). Olivier's CAB.OVL gives very detailed descriptions on what
the connection problem is. Try it (if you haven't already) from:
http://services.worldnet.net/vcf-com/sting.htm

BTW: Are you always describing your problems in so much detail Kevin ? ;-)

>adapters, not on any drives.

Did you fit you connect it to the underside of the host adapter?

>Is there anything else you need to know about this ?

Is there any advantage by using a drive with parity enabled?

If I fitted this to the host adapter, would an SCSI that didn't have
parity enabled, work ok?

I downloaded an article from Mark's Mega STE Page a year or two ago (that doesn't seem to be accessable now) and that suggested that Atari had forgot to include 'power good signal' from the internal host adapter to pin 40 on the hard drive. It recommended that you split the ribbon cable (for pin 40) leading to the hard drive, and connect a +5 volt to the hard disk side of the cable split. Is this a modification you have done or would recommend?

Cheers

Hi

I had the same problem, and seem to have cured it by removing the auto program Pinhead from the boot up, since I did that Sting has connected every time:-)

I only mention this if you have that program installed, or it could even be another program causing the problem.

Hope that helps mate.

Actually it has to do with some of the config variables in STiNG.
I had someone who tracked down the offending section and once they removed
it everything worked fine.

I checked again and this time I was able to reproduce the bug. The
format line in sigs.inf read:

\pipe f:\aphorism.ttp citaten.txt

But there was no f:\aphorism.ttp. It turns out that Pexec() bombs if
you feed it a non-existent program. It shouldn't, it should just
return an error code, but instead it messes things up terribly. I
built in a extra check now, and only execute Pexec() if the program
exist

Hi

You'll need a cable to plug the hard drive into the hard drive port (at
the back of your STE), then all you need is the hard disk driver. With a
little luck it may be set up ready to go;) You won't know until you get
a cable;)

This is interesting. So it's the DSP that's doing the majority of the
work then (yea, I knew that.. but....).
I'm no programmer (heyhey!) but is there no way to use the cpu and
optional fpu also? Three times the horse power! :-)

Thanks to everyone for all the links and information - it seems that
using MiNT I'll be able to turn the ST into a pretty intelligent little
terminal (lynx, pine actually running on the ST etc). I've given up on
NFS - I now know it would be possible, but ridiculously slow over a
19200 bps null modem connection (115200 bps is bad enough, particularly
when you've got used to ethernet...) I'm not altogether sure how useful
it would all be, but if I can teach my mum how to use pine for her email
it'll be handy.

It'll give me something interesting to do over the summer, at any rate.

Bye...

>you check the settings of scc.prg in your auto folder? Receive buffer should be
>set to 2048 or larger. And, naturaly, drvin.prg has to be executed first,
>followed by scc.prg.

DRVIN has the following settings:
FASTINT=n EXOPEN=n

SCC has the following settings:
M2TT=u M1EMU=u LANBIT=n LANEXT=n LAN_S2=u DTRM2=y DTRS2=n
M2DRI=n S2DRI=n RBLM2=8192 TBLM2=8192 RBLS2=8192 TBLS2=8192

does that okay to you - certainly the receive buffer is >2048

DRVIN is the first auto program to launch, followed by SCC and then
stuff like WDIALOG, NVDI, and finally STING. I'rm running STinG 1.15
with all the modules active, under TOS 4.04 on a 4Mb Falcon030 which
is AFAIK standard apart from an FPU (I bought it secondhand, but I
don't think it has been modified).

I get a very reliable connection with the SERIAL.CPX set to 19k2, but
any faster than that is very unreliable - basically the script
processing slows to a crawl and grinds to a halt at some point. This
is the case with both my Zetnet and Freeserve accounts (when I could
access the latter...)

Interestingly, I could set the SERIAL.CPX at 38k4 and get a reliable
connection with an old 14k4 modem, but with my 28k8 modem I can go no
faster than 19k2 :-/ It is also strange that _sometimes_ it does work
at the faster speeds, but not often enough to make it worth keeping
the .cpx at anything other than 19k2 :-(

I was going to buy a 56k modem, but I think I'll wait until (if..) I
get this problem sorted out!

Thanks for your help,

Ashley

Interesting :-) Have you heard of X-Stream, James? This is similar
but their 0800- call periods are more restricted (midnight to noon Fri
and Sat, usually).

>Its being offered by the Tempo chain of electrical stores, who are giving
>out CD-Roms with the PC and MAC software on it.

Do you know the address of its registration site (www.tempo.net???)
then we could try it on-line?

>Does anyone know if this service could be used on an Atari, just like with
>Freeserve can be after the registration has been done on a PC??

Most of them are standard PPP nowadays (apart from X-Stream which
seems to need a special (PC) dialer/authoriser program).

>
> What's wrong ?

Hi Maciej,

it's probably the font format that's wrong. NVDI only handles 8x16 type
fonts as a system replacement. In case you choose another type (7x12,
7x14, whatever) you either need: MagiC, N.AES or TOS combined with
VDIFONT.PRG (plus GDOS/NVDI of course).

2187. Re: HD Driver 7.61 (nope!)

Newsgroup: comp.sys.atari.st
Date: 1999-05-04 00:00:00 UTC
From: bjr@master.localink4.com
Message-ID: <7gnh2enfa1@remarQ.com>
Source record: 79491

Uwe Seimet (us@ooc.de) wrote:
: Put CAF_FIX.PRG in your AUTO folder, this will reduce the timeout value.
: Note, however, that if you have a very slow SCSI device connected to
: your Falcon shorter timeouts mean that transfers of large amounts of
: data in a single block will fail. This is because it's impossible to
: decide if a transfer ist still running correctly or if the Falcon SCSI
: bugs cause the delay. Unfortunately you can't solve most hardware
: problems by software.

This patch is okay to use under MagiC 6.1?
I've ALWAYS used it under normal TOS/MiNT and such, esp with CAF setup,
but disabled all the socalled TOS PATCHES under MagiC out of fear the
patch might change something in a way that doesn't jive with MagiC.

Could it be that this this CAF_FIX might stabalize my Falcon so background
DMA can be used?

Really, I'm not so SURE background DMA is what causes my Falcon SCSI
lock-up problem under MagiC 6.1, but I did notice right away that
disableing all HD and Floppy back ground DMA access reduced SCSI lockups
to the point of EXTREMELY RARE. The only lock up I've had since, 'seemed'
to occur because I did a very massive folder copy from one partition to
another at the same time STik was doing an FTP transfer at 6000kps, and,
the Falcon was in 256 color mode.

Sometimes in a session, I'll enable background DMA access just to see how
sell things go. I do get a lot of lockups then...most commonly when
using CAB online...and I figure it's the old bus problem here since
CAF is using modem 2 at pretty high speeds, bus bandwidth to display 256
colors, and then some cacheing all the stuff to hard disk.

And to beat a dead horse...I say again..it all works VERY WELL, lock-up is
RARE with background DMA acess disabled.

I'll try with the CAF_FIX and see how it goes with MagiC and background
DMA enabled.

Oh, btw...
I did experience some problems with SCSI lock up when formatting some
floppies with background floppy DMA enabled as well. I'm enclined to
believe this is a MagiC problem of some sort, cuz I get all kinds of
file error problems under MagiC 6.1. As in....TOS error 35, you can't
delete that! I keep a close watch on the hard disk however, and they are
not 'corruptive' errors...usually a reboot puts thing back to normal.

>needs to.

Actually he wrote Centronics port which would not hurt as the modem
most probably is connected to a serial port. But then the ip 0.0.0.0
would not make any sense (on a LAN) :-)

As I have already said in an other post: If you don't want to run a LAN
simply delete STNGPORT.CPX and STING.PRT!

To me his problems sounds like a DNS problem. He should first try to
activate "Request Name Servers from remote" in DIALER.APP - Configs -
Addressing. If this doesn't work adding the DNS address directly should
get things going.

To test his connection he should first try to Ping his ISP with
numerical address. If this works his connection is basicly working.

I just wanted to cover all the bases, Louis :-)

It's just that I raided Thing and grabbed a few fonts for use with MagiC
(like the lovely Dcheneva). And two people who grabbed the ISO 8859-1
Monaco Mono font didn't know how to install it.

It has probably been partitioned previously so all you need to do it
plug it in, power-on and re-boot.

If C: does not appear on the desktop you will need to 'Install' drive
C: from the GEM desktop.

When you can see what's on the HD you may decide to re-partition it
etc. when you will need AHDI (or similar) but it's probably on the HD
already.

Math lesson:

ok I'll simplify my madness for everyone
1024 * 1024kb=1048576 bytes=1Mb

since a k=1024.....and you need 1024 of them in computer
terms.....get it, now what was i saying, oh yeah.....

Yes it is 1024KB but without knowing what the full figure is(1048576), doesn't
that make a person wonder why atari didn't round 1024 up to say 1030 and name
it the ....., oh wait that was a modem. ;-)

maybe making sense,
BGarvey

everyone see where i'm coming from?

If you want an Atari HD, your looking for some very old stuff on the 2nd hand market. Things like Megafile20/30/60 or SH204/205 drives. I really wouldn't recommend getting one of these, because they are old, slow, small (in capacity, not in physical size!) and prone to failure.

If I were you I'd get either a SCSI drive with a SCSI host adapter or an internal 2.5" IDE drive with an IDE controller board. Check out the Quick FAQ for details.

2201. Sufix for HD6301?.

Newsgroup: comp.sys.atari.st
Date: 1999-05-05 00:00:00 UTC
From: Stephen Moss <sgm23@eng.cam.ac.uk>
Message-ID: <7gpgkj$5ke$1@pegasus.csx.cam.ac.uk>
Source record: 79355

Anyone know waht it ?, I'm trying to get some data on it (HD6301 keyboard controller), I have contacted Hitachi and they want to know what the suffix is.
They are suggesting X as in HD6301X or V as in HD6301V but I think it might be V1 as in HD6301V1, if anyone knows it would be helpful as I don't really want to have to disconnect my ST and take it apart to check.

Cheers,
Stephen Moss.

> **********

Hi Steve,

Not sure what you mean by using the U or W?
I notice that there is a Floppy to File mode in the software.
But see no U or W option.

All the backup options that I can select are mostly numbered.
Like 1 thru 79.
BTW what version of the software do you have?
I think mine is version 2.7 or 2.7A.

Also, does it matter if the hard drive is a SCSI or Megafile type
drive?

I have both for my STE, was just wondering if that makes a difference
when doing a Floppy to File mode?

Thanks,
phantomm@kih.net

>
>Now you are kidding right???? AtariQuake??? (I'm a looking...!!)

I'm not kidding.
The problem with finding it is that it, like a lot of other Quake
versions that showed up some time ago, is illegal. Someone stole the
sources for the Linux version of Quake off an ftp server somewhere
and they ended up all over the net.

I don't know if an '030 version was ever compiled of Atari Quake.
It would probably be impossibly slow (Quake uses lots of floating
point calculations and the '040 is about ten times faster at that than
an '030+'882).

I'm not entirely sure that you even _can_ find the Atari version on the
net, since it was rather tightly held (for obvious reasons) and really
mostly an experiment anyway (since there are very few Atari compatible
machines where you'd have any kind of chance of actually playing it).
The sources themselves are probably still around, though, and compiling
them under another Linux version is a really simple job.

>> around 10-15 fps, IIRC.
>
>This is interesting. So it's the DSP that's doing the majority of the
>work then (yea, I knew that.. but....).

Yes.

>I'm no programmer (heyhey!) but is there no way to use the cpu and
>optional fpu also? Three times the horse power! :-)

Actually, I don't think it's at all unlikely that BAD MOOD could be
faster on a Falcon+AB040 _without_ using the DSP. On a machine with
reasonable screen access bandwidth (like the Milan etc), it definitely
should be.

Unfortunately, there is no m68k version of the code that's currently on
the DSP. :-(
It would be a rather large job porting that back again...

I'll tell you something Chris, you all probably don't realise just how alive the Atari is. I've return after three years, but a few months back I was amazed to find many companies still around and still supporting the ST/Falcon scene. Most of the people are still here too!
Software support is almost as good as it was back in late 96. It seems to be now mostly French or German, but wasn't it always?!

It's almost as if nothings changed in many ways. I think you just don't see it because you've never left.. iyswim :)

I wish I'd never have left tbh, but back then I couldn't afford to keep two machines. Now I can! :-)

I've always had the ST emulators, but that's not the same..

Anyway, back to the Falcon!

This may be of some interest to UK members of this group.

Freecall-UK are offering free phone connection to the internet (0800-) in return for permission to send selected advertising material to your Inbox. This sounds a bit like BT's recent initiative to give free voice calls if you don't mind being interrupted by the occasional commercial.

The registration works rather like a chain letter. You can find details on:

http://www.freecall-uk.com/join.htm

If you decide to get in on the act I would be grateful if you could put my name in the final box of the reg. form (Referred by:)

>whatever-2 implementation right... :-)

Let me say in advance that whatever criticism is dripping from my fingers now, there's no disrespect for this programme nor its creator.. I shouldn't repeat myself for the umpteenth time , but never mind...

What Louis means is that when Jos points out in his docs that the
ISO -8859-2 is "principally based on the existing Polish Atari system set"
Jos is really saying that Okami is only supporting the Polish Atari system set and just that
[as far as ISO Latin 2 is concerned]. It certainly is not a full implementation and it cannot be
such since it needs a completely different approach.

But why should Jos bother??

There are more [not that many though, Krzysztof] that would need ISO Latin 2.
Take the Czech Atarians. They're active enough:

the Atack-group [Krivankove] writing aFree, aMail, AFTP etc.
the Joy-group [Petr Stehlik] writing MSWordView [converting Unicode MS Word 8 files into HTML-files, on an Atari !!! Have you ever seen such programme under Windozes??]

The Czech use their Kamenicky standard that is just as idiosyncratic as the Polish Atari. What do
their Czech messages look like in Okami??

Or how about Slovenians? Ever heard of the universal Atari wordprocessor named STEVE written by Primoz Jakopin??

What I would like Jos see writing is a [pre-]module in which the user can state whatever characterset
he/she is using [Polish Atari, Kamenicky, ISO-8859-2, Rein_PL] and have separate tables with
the transition to/fro that particular 'standard' and the most cognate ISO standard [ISO-8859-2
for all cases mentioned]. Okami is using plenty of separate data-files, so a few more shouldn't
be a problem.

Jos should make his own priorities in the end, but it would be a shame if this programme [Okami] wouldn't get the exposure it deserves. And the expansion of the EU will not be restricted to the Poles.. ::))

Greetings, Rein

You wrote in an earlier post:

>LOGIN.BAT is activated as per the script and the message 'success' is
>displayed. My ISP has confirmed that I am making the proper connection
>and am online via PPP.

Is this still valid? If so turn off "Run login batch after logging in"
in the "Configs" - "Miscellaneous" page in the dialer. This is only
used if you want to automaticly run programs right after the login.
(With an invalid LOGIN.BAT STinG behaves very strange on my Geneva
setup and kind of hangs.) This could explain the bombs you are getting.

If you actually are online (as your isp said) it definately should work
to ping your isp's nameserver with numerical address! If this does not
work you are _not_ online.

> My ISP supplied me with the actual settings I need. My PC PPP
settings
>work perfectly every time.

OK, fine.

Then compare the remote connection on the pc!

Right click on the connection icon and select "Properties".

Click on the "Scripting" tab. If the filename field is empty you will
not need any "dial script" on the Atari either.

Click on the "Server Types" tab. Check if "Require encrypted password"
is selected. If your pc setup does not work unless this is selected I
think your isp requires CHAP. If so STinG will not work at all!

In the same tab click on the button "TCP/IP Settings...". If "Server
assigned name server addresses" is enabled you can do the same in STinG
by enable "Request Name Servers from remote". If it is not enabled (on
the pc) you will find the domain name server address(es) entered. Use
these address(es) in STinG as well!

>
>> (2) What is your default page in CAB? Is it trying to connect to
>> something which doesn't exist?

Don't bother with CAB at all until you can ping first with a numerical
address and when this works with a domain name like "tripnet.se" or
"chebucto.ns.ca" (without the " " of course) to test that you have

contact with a valid nameserver.

> They didn't mention it. They use PAP which I have set up and they
>checked over the dialing and default scripts and said everything looks
>good. They (and I) are stumped as to why it doesn't work.
>

My guess is everything is (was?) OK except for the disastrous "Run
login batch" setting. I had to reboot after testing with this turned on
on my setup!

Imho, as he does not fully understand how STinG works the best way
would be to try to simplify the setup as much as possible. The more
possible places to change things the more problems he may run into. I
also first made lots of text editing (some very stupid) to make it
work. But with my present setup the DEFAULT.CFG is not altered at all
except for ALLOCMEM and I am using STinG as router on a LAN with
masquerade and with two different isp's (without rebooting between
logins). The two different DIAL.CFG I use are exactly as saved in the
dialer config dialogs.

Hi all!

For my website I've been given a PowerPoint 4.0 file, which apparently has some photos in it, which I'd like to view, and possibly convert for use on the site.

Anyone know if an Atari can read or extract these pictures?

I have PowerPoint 3.0 on my PC at work, but it can't open them (though I'm hoping that in a couple of weeks I'll be getting a new PC, which'll hopefully have 4.0 installed).

Cheers!

James

Source record: 79371

Hallo Ashley!

AS>SCC has the following settings:
AS>M2TT=u M1EMU=u LANBIT=n LANEXT=n LAN_S2=u DTRM2=y DTRS2=n
AS>M2DRI=n S2DRI=n RBLM2=8192 TBLM2=8192 RBLS2=8192 TBLS2=8192

Looks okay to me. For the send buffers, 1024 would be sufficent, but that shouldn't make a difference.

AS>I'rm running STinG 1.15 with all the modules active, under TOS 4.04 on
AS>a 4Mb Falcon030 which is AFAIK standard apart from an FPU

That should work okay. I'm not having a working setup for STinG under SingleTOS, though, because I'm using MagiC.

AS>I get a very reliable connection with the SERIAL.CPX set to 19k2, but
AS>any faster than that is very unreliable - basically the script
AS>processing slows to a crawl and grinds to a halt at some point.

The latter sounds not so good. What screen resolution and colour depth do you use, and which is the value for "delay" in the STinG internals cpx?
Is the serial port set correctly to 8n1-RTS/CTS? Try with a Terminalprogramm like connect or StarCall: type in at&v&v&v&v[return] to force the Modem to send back it's settings several times. Check the result, if there are apparently characters missing. Check the cabling, try another modem cable.

AS>Interestingly, I could set the SERIAL.CPX at 38k4 and get a reliable
AS>connection with an old 14k4 modem, but with my 28k8 modem I can go no
AS>faster than 19k2 :-/

Well, that sounds like either the modem or the cable is broken. Try the cable from the 14k4 Modem (if available) and check with that modem if 38k4 still works.

AS>It is also strange that _sometimes_ it does work at the faster speeds,
AS>but not often enough to make it worth keeping the .cpx at anything
AS>other than 19k2 :-(

Are you sure it is the computer-modem connection that lacks reliability? It might also be a bad telphone line that causes the modem to make retrains, thus considerably slowing down the transfer rates. You could try setting the maximum transfer rate to 26k4 or 24k0 (see modem manual for details) and try it that way, if the modem-computer connection seems to work at 38k4 in a terminal program.

mit freundlichem Gruï¿½ aus Ahornberg

You could use Amail, which is much easier to use for beginners. (Nice
GEM-Interface,
works with attachments and so on...).

No. AFAIK it´s a Bionet-Client for Magic.

Ok then. I thought you were attempting to activate local connections through
the dialer. Using it simply to fix settings is a perfectly valid usage.

>I'm currently struggling with the proper setting for "subnet mask" in the
>masque section of sting port cpx.
>The settings are as follows:
>Milan is 192.0.255.1
>Falcon #1 is 192.0.255.2
>Falcon #2 is 192.0.255.3

I'm not sure exactly what you mean here. The Masquerade port (pseudo port)
does not use any subnet setting. The presence of such a setting in the
STNGPORT.CPX should simply be ignored. It is just there by mistake, but
it will never be used for anything.

Also, the IP numbers of the Masquerade port, _both_ the normal IP and the
'masking' IP, will only be used internally on each machine. They will not
ever be used in traffic with other machines, or with Internet, so these
do not need to altered from original defaults on any of your machines.
In fact there should never be any need at all to edit any of the settings
of the Masquerade port except the MTU size, which should be set equal to
that of the reall modem port.

Also, you should not include Masquerade in ROUTE.TAB, but let the dialer
create its route automatically (set in 'Configs'\'Miscellaneous').

Finally, the Masquerade port should only be activated by dialup on the
modem machine, so on other machines you do not even need to install
this STX module.

>Which IP should I use as subnet mask in the masquerade settings?

None, as should be clear from the above.

>Currently it is 192.0.255.0, but that gives me trouble when connecting to my
>ISP. As long as masquerade is disabled, everything will work fine. As soon as

>connecting problems.

Yes, that will always give problems. Only the dialer should activate it.

>Nevertheless, I'd like to know how this "subnet mask"
>works. Masque.hyp didn't help me :-(

That is because no subnet mask is needed. It should have been 'greyed out'
for the Masquerade port in STNGPORT.CPX, just like it is for most other ports.
Just ignore it, and keep it unset.

>RA>and at present STinG does not work as a PPP host
>
>And why not? Is that so much different from working as a PPP client?

Yes. A PPP host must implement a login procedure for the other side, and
that means implementing a password system, as well as one for allocation
of local dynamic IPs. These things could be useful in using STinG for a
BBS system based on TCP/IP, but they would add significant complexity to
the SERIAL.STX (which contains both the SLIP and the PPP implementations).

>RA>For that to work properly you _must_ raise the reception buffer size

>
>I already did so prior to my PINGing experiment, set it to 32k or so.
>Currently, none of the falcons is in operation, so I can't check right now.

Ok, just as long as you realize that a large reception buffer is absolutely
necessary for ports that lack hardware flow control.

>Yesterday, I've been trying to connect the two Falcon's LAN ports, but that

>
>In chips 'n chips hypertext by Michael Ruge I found the following pinout:
>
----- snip ----- re: your LAN-to-LAN RS422 null-modem cable

>Is this supposed to work, and if so, which settings should be done in the
>scc.prg?

That's hard to say. AFAIK no one has ever been able to make the LAN port
behave properly, and attempts to configure the LAN settings in SCC.PRG have
led to very strange results. I strongly suspect bugs in the LAN sections of
this HSModem module.

One note though: LAN port pin 7, normally marked as 'Reserved', actually is
connected to an input driver that feeds the DCD input of the SCC. If these
are connected straightly between two units, then they both 'listen' to this

input, with no one feeding it any signal. That seems nonfunctional to me.

>I tried it with starcall, but didn't see characters coming through
>correctly. Serial port settings (speed, 8n1) were identical, of course, and so
>were the settings in scc.prg.

The things you mention seem ok, but I'm afraid lots of people have failed
to make use of the LAN port, and never saw a proper explanation for it. I
think that the HSModem LAN drivers are either bugged or lacking in their
documentation. Just following normal instructions won't work for this.

Hmmm. The big question here is whether those variables are part of the
standard setup, as included in the STinG distribution, or some stuff that
they (or someone else) had added. There are a lot of scripts about, and
some do contain dubious stuff. Hopefully their reply will clarify that.

> So before I get a bunch of people hacking at their default configs

You can't connect _with_ it either, it just looks that way.

>It reports 'Initialising (sic) link', counts 2 seconds
>and disconnects - every single time. When I select Active in the port
>settings, I connect but get no resolved host.

No, you do _NOT_ connect properly with the port already Active.
It simply doesn't work that way. And that is the reason why no
traffic will work then, including PINGs.

>> >To test his connection he should first try to Ping his ISP with
>> >numerical address. If this works his connection is basicly working.
>
> I tried pinging and was instantly disconnected each and every time.
>I'm running out of options to try. :-(

Of course you are disconnected. You have not then logged in properly,
and your outgoing traffic will not be using the correct dynamic IP.
That is sufficient reason for most ISP modem pools to disconnect you.
(Some don't care, which is no help, as traffic still won't work.)

----- snip ---- re: SCSI 'freeze' recovery time of CAF_FIX
>
>I don't know it by heart. About 30 seconds or so.

Ok, I guess I can live with that. Note however that CAF_FIX could be
improved by the timing check I suggested, so that even a 30 second
delay does _not_ cause SCSI reset, except when it happens in such a
way that the DMA addresses are 'frozen'. That should decrease the
risk of any unwarranted SCSI resets being generated.

>> Ok, you are the SCSI expert, not me.
>> But is there really no way to test for a real error ?
>
>Unfortunately there isn't.

Well, I can't help wondering if you have looked closely enough at all
possible ways of testing for it indirectly. I fully realize that there
can be no direct way of testing it.

>> For example, even when large amounts of data are being transferred in
>> a single multi-sector DMA block, it should still be possible to check
>> the DMA address and/or sector counters.
>
>No, since it is legal that a SCSI device stops a transfer for certain
>reasons. For more information take a deep look into the SCSI-2 or SCSI-3
>specification.

Surely such a mid-transfer stop would be of entirely different magnitude
from the total expected transfer time of a multi-sector block. I can not
imagine any circumstance where it would be proper for a normal harddisk
to go 'off for lunch' in the middle of a transfer, unless it last only
a very short time (on the order of a few seconds maximum).

I did not mean that the method I suggested could entirely replace a
timeout, but only that this kind of checking could make it safe to
use a much shorter timeout period, since that would be restarted when
tests show that the registers I spoke of have not been 'frozen' long.
That should prevent the unwarranted SCSI resets that could otherwise
result from using a short timeout.

I still don't see the error in my reasoning. Please explain it.

>> Note also that this is NOT just a Falcon specific problem.
>
>It definitely is a Falcon specific problem. Other machines don't have

>this hardware bug.

I did not say that it is not a Falcon specific problem, it certainly is.
What I said was that a similar problem can also occur that is dependent
on a problem with some SCSI drives. So it is not *just* Falcon dependent.

Naturally the cause of those problems differ, but the effects for a user
are the same, and the same recovery methods apply.

2232. Mega ST4 FOR SALE!!

Newsgroup: comp.sys.atari.st
Date: 1999-05-05 00:00:00 UTC
From: angel <angel@bge.net>
Message-ID: <TH4Y2.4$W_3.99368@news.axxsys.net>
Source record: 79386

I have an Atari Mega ST4, 4MB computer w/built-in 3.5" disk drive, external 3.5" GTS 100 disk drive, 44 MB Seagate hard drive, 12" SC1224 color monitor, 19" Moniterm monochrome monitor (new), two Atari mouse units, and 15 44MB removable disk cartridges.
Unit comes with loads of games on disk:
GAUNTLET, ULTIMA IV (Quest of the Avatar), KARATE KID Part 2, DEJAVU, BALANCE OF POWER, CAPTAIN BLOOD, THE BARD'S TALE, DUNGEON MASTER, CHAOS STRIKES BACK, CHESSMASTER 2000, STARGLIDER, AND THE UNIVITED, Plus many more!
Unit also comes with PAGESTREAM 1.8, PRINTMASTER +, MAVIS BECON TEACHES TYPING!, AEGIS ANIMATOR ST, SALES-PRO PLUS, CARTOGRAPHER 2.5, NeoDESK 3 (The Ultimate Desktop), QUICK ST II SCREEN ACCELERATOR AND CUSTOMIZER PROGRAM, STAccount's INTERGRATED ACCOUONTING PACKAGE, A&D'S UNIVERSAL ITEM SELECTOR 3.0, MICHTRON'S HARD DRIVE TURBO KIT PROGRAM.
The system includes various Hybrid Art's MIDI programs:
GENPATCH ST, MIDI-TRACK ST PROFESSIONAL, GENEDIT ST, EZ SCORE & EZ SCORE PLUS, HYBRID SWITCH, LUDWIG COMPOSITION PROGRAM, AND SMPTE TRACK MIDI RECORDER PROGRAM.
Other MIDI programs are: MIDI Master Drummer 2.1, Kawai K1/m/r/ll manager & Vol. 1-3, Kawai Multi Editor, and the Kawai K5 Editor w/MPE and back-up disk.
5 Sound Source Unlimited sample disk:
TV/Film Collection, L/A Collection, Fantasy Collection, Digital Synths, and the Soundtrack Collection.
System comes with tons of BRE Software disks which include Pagestream graphics, a Commodore 64 emulater, an Atari 800XL and 130XE emulators, Print Master graphics, copiers, label makers, games, etc., etc., etc.
Finally...the system includes a Super Charger unit w/DOS 4.01 boot disk and program, Monitor master unit, and Goldern Image's Touch-Up hand scanner with software and manuals and 2 Golden Image mouse units. I will also include a 1040 ST and a non-working SC1224 12" monitor and a non-functioning 19' Moniterm monochrome monitor, too, but no one has to take the non-functioning units if they don't want nor need them.
Obviously, too much to list. Everything that is needed will be included with the system; cables and manuals.
Regretably, I must sell the system for the funds, but I will not give it away. I'd rather use it in spite of everything.
If anyone is interested, please correspond to angel@bge.net. I can provide more details about the system and will accept any reasonable offer for my prized Atari ST.

Hallo Brain!

BR>BNET for sting mounts drive partitions across TCP/IP.

Well, the last time I tried it (Version 2.05), it just bombed one of my Falcons into the ground. No go at all, as soon as the xfs was installed.
[some time later]
I tried it again, this time having the two Falcons tied together via their LAN ports. Still no go.
On Falcon #1, the system will lock during boot as soon as screen blaster tries to show its resolution menu respectiveley change screen resolution. BNET.APP itself makes no problems, though. But it would only show an completely empty drive P:.
On Falcon #2, both XFS and BNET.APP are running. That one is equipped with Screen Wonder PRO resolution enhacement hard/software. Anyway, although the programs are running, and the /BNETWORK/ entry is there in the U: drive of that machine, it is not usable. Inside BNETWORK sits a folder called Falcon1, representing that remote machine. Opening that one results in a bunch of folders called Ax, Cx, Dx, ... up to Lx. Obviously, the information on the drives is being transmitted correctly. Sadly, those folders cannot be opened or in any way manipulated :-(

Please, tell us more about this offending variable.

Bye,
/Pascal/

>problems by software.

Ok, you are the SCSI expert, not me.
But is there really no way to test for a real error ?

For example, even when large amounts of data are being transferred in
a single multi-sector DMA block, it should still be possible to check
the DMA address and/or sector counters.

If those freeze up for for just a few seconds even, that will mean that
no data is being transferred, probably because the SCSI bus has been
locked by a device, or due to some other hard error.

Note also that this is NOT just a Falcon specific problem.
I have had similar lockups that definitely depended on the drives.

If the method I outline above can be applied at all, it should also
solve those drive dependent problems, as long as such a drive will
respond properly to a SCSI reset (as I think most would). And it
should allow much faster recovery than what CAF_FIX can provide,
while providing greater safety against unwarranted SCSI resets.

Hi Mike,
I'm always happy to help other Atarians.

----- snip ----- re: archive file names of host adapter patch docs
>
> I don't actually know the file name, I just clicked on the link on
> Joe's site. The same things on Hallvards Launchpad, and that comes up
> with an error as well.

If you use CAB the full URI is visible in the status line of the browser window whenever you move the mouse over a link (no clicking needed). For a download link that URI will normally end with the name of the file to be downloaded. (CGI exceptions exist of course.)

----- snip ----- re: my own parity patch design based on the 74HC280
>
> This was provided by Martin Graiter.

Then it is most probably derived from the one I made, and in any case Martin Graiter does have the competence and info needed to modify it without losing functionality. Thus, you can rely on it, though you do not need to feel bound by its recommendations for how to fit it.

----- snip ----- re: fitting the patch to a host adapter.
>
> Did you fit you connect it to the underside of the host adapter?

That is mostly a matter of where you can find the best room for it.
I don't have any MSTe machine, but have mounted an MSTe host adapter in a Mega ST. This is also modified in some other respects, so my precise way of doing it may not suit your needs.

>>Is there anything else you need to know about this ?
>
> Is there any advantage by using a drive with parity enabled?

No, not with a patch like this, since it simply forces the parity line to always hold correct parity. No parity tests will be done anyuay.

> If I fitted this to the host adapter, would an SCSI that didn't have
> parity enabled, work ok?

Yes, both drives with and without parity will work, even when connected at
the same time.

> +5 volt to the hard disk side of the cable split. Is this a
> modification you have done or would recommend?

The term 'Power good signal' is incorrect. That is a signal often used with
switching power supplies to switch power off before hardware can be damaged
by erroneous voltages, or to protect the supply itself from overload.
This has nothing to do with a SCSI bus.

The correct term is "TERMPOWER" (or similar) and is a +5V supply intended
only to drive the termination resistors of connected drives. Most drives
supply this voltage as an output, but some few do not. Some host adapters
need to use this as their supply voltage, but not the MSTe adapter, which
gets the supply voltage with the other signals through the connector that
is plugged into the MSTe.

Some drives may want that voltage, but none of mine need it.
(They feed their terminators internally.)

The drawback of connecting the +5V of the MSTe to an external bus is that
accidents (eg: ribbon cable made with misaligned leads) may short circuit
the MSTe power supply. If you make the mod you should have a _fast_ 1amp
fuse in series with it. In fact the SCSI specs require such a fuse to be
used in any device that feeds the TERMPOWER voltage.

Another protective device is to also pass the current through a diode,
before reaching the TERMPOWER lead. This way several such units (drives)
can feed the TERMPOWER lead at the same time, without harming each other.
The diode naturally causes a small voltage drop, but in most cases this
does not matter.

Note that this diode doesn't eliminate the need for a fuse, since the
diode only protects against back currents coming in from the bus, whereas
a short circuit on the bus would draw current in the forward direction,
from the feeding device (here MSTe) out to the bus. So both are needed.

Hi again Dan,

Can you please report which variables were involved ?

Does this mean thay you have implemented new variables in STiK,
or for CAB.OVL rather, which are incompatible with some used
by the STinG kernel ?

If so, we need to agree on what to do about it.
(Here, in beta list, or in private mail, as you please.)

But hey, Jos

If someone gets this error it must mean that he is running Okami without having edited the sigs.inf from your defaults, which means that he'd be signing all his messages with _YOUR_ sigs IIRC. That makes no sense.

IMHO the installation had not been completed, and then Okami really can't be expected to work right. (Though it should try to avoid bombing.)

Still, this does illustrate the need for the kind of improved docs that we discussed the other day, making it crystal clear which files to edit and how to do it right. (But of course, after your planned updates.)

Hello,

My question: "Scan Rate" - is that the horizontal or the vertical range on my monitor? I have a "14 Magnavox SVGA. Actually it says Philips on the back and in the manual, and the model # is CM 2089. According to the manual, the rates are Horizontal = 31.5 - 35.5, and Vertical = 56 - 87. I have tried both Videlity and Videl Inside, but just can't get an 800 x 600 display in any color setting, with or without interlace. Is the problem a result of the limited frequncies of my monitor? I have Nemesis.

(I did, however, get something around 1100 x 800 in mono. Very useful for programs like LOGIC, LOGIC AUDIO, and X_Or.)

Thanks,

I've forwarded the message I received to the person that started
this thread. Hopefully they will try it out and let us know if they have
the same effect as the person that emailed me. As to what specific
variables it was in STiNG that area is kind of vague. They had a section
of the default config that they removed entirely and then all the modules
started functioning properly.

So before I get a bunch of people hacking at their default configs
and possibly making a mess of their setups. Why don't we see what the
results are. Should probably show up in a day or so. Since I don't use
STiNG, I've never really had a chance to verify their results.

Unfortunately if I don't select Active in my port settings, I can't
connect at all. It reports 'Initialising (sic) link', counts 2 seconds
and disconnects - every single time. When I select Active in the port
settings, I connect but get no resolved host.

> >To test his connection he should first try to Ping his ISP with

> have it set, CAB will fail to resolve.

They didn't mention it. They use PAP which I have set up and they
checked over the dialing and default scripts and said everything looks
good. They (and I) are stumped as to why it doesn't work.

This is obviously not right, then. Have a look at your DIAL.SCR. The
variable DEF_ROUTE should be set to TRUE. If it isn't, you can either edit
DIAL.SCR in an editor or use the dialer - check the "Default route through
port" option.

Also check your ROUTE.TAB - the active line should read:

0.0.0.0 0.0.0.0 Modem 1 0.0.0.0

Just change the port name if you are using Modem 2.

I wonder if you have the right, or any, nameserver addresses in your
dial.scr? If that's missing then your ISP won't be able to translate the
Human-readable www.where.what.whatever into the numeric address that is
actually used to access that URL.

If your ISP supports it and you're using the latest version of the STinG
dialer, you can get the nameserver address dynamically from the ISP.

It is since it has nothing to do with the operating system. It simply
changes a setting in HDDRIVER and doesn't affect anything else.

> Could it be that this this CAF_FIX might stabalize my Falcon so background
> DMA can be used?

No. It does only what I said it does and nothing more. If background DMA
doesn't work with your Falcon you have a hardware problem. And if it's a
lockup it's most likely the usual Falcon SCSI/DMA problem. The Falcon is
simply broken in this respect.

No, since it is legal that a SCSI device stops a transfer for certain
reasons. For more information take a deep look into the SCSI-2 or SCSI-3
specification.

> Note also that this is NOT just a Falcon specific problem.

It definitely is a Falcon specific problem. Other machines don't have
this hardware bug.

You should just plug it in. Since it can only work with an Atari,
chances are it will either already be formatted and partitioned. If not,
just get the latest AHDI driver from the Quick FAQ.

This is a very old drive with a 20Mb capacity.

My theory is that they rounded up 512Kb to 520 (like on motorbikes), and
then doubled it with the 1040.

2260. CAF HELP

Newsgroup: comp.sys.atari.st
Date: 1999-05-05 00:00:00 UTC
From: Jacques Rypko <rypko@lal.in2p3.fr>
Message-ID: <373057CC.42AF@lal.in2p3.fr>
Source record: 79438

hello
Perhaps somebody can help me !

Here is my fist probleme:

When I record an audio file toto.aif on the
empty part (500megabytes) of my HD,always
there is a creation of an other empty file,named
toto1.aif.
If the size of toto.aif ,for example,is 100megabytes,
then toto1.aif will be a size of 400megabytes(this
file is empty) ,I have always the sizes:
toto.aif + toto1.aif = part of HD, the part is full.

I asked Steinberg France about this probleme,they answered
me laconicly: it looks like to a virus named "spacefiller".
I don't know if it is a joke !
What do you think about this probleme ?
Do you meet the same probleme ?
How to avoid the creation of this empty parasite file ?
How to erase this empty parasite file in CAF ?
What about the answer of Steinberg France,is there a virus ?
How to kill this virus,where can I find an antivirus
program ?
Here is my second probleme:

When I load CAF,I can see there is 1megabytes RAM free left on the
totality of 14mega.
Is it normal ?

best regards J. Rypko

Hi Neil,

since he was talking about Thing and Jinnee fonts, I'm pretty sure it's
the format. These are no 8x16 types. I once tried them myself but NVDI
won't take anything else but 8x16's. I reckon he's been smart enough to
put the S'es where they belong and shove the fonts under the appropriate
screen rez :-)

I've never owned CAF, so I'm not 100% sure, but I beleive that's normal.
Cubase reserves the entire HD partition for it's own use.

> I asked Steinberg France about this probleme,they answered
> me laconicly: it looks like to a virus named "spacefiller".
> I don't know if it is a joke !

Steinberg France don't give a damn about the Atari market, and they
probably don't even know what an Atari looks like any more.

> What do you think about this probleme ?
> Do you meet the same probleme ?
> How to avoid the creation of this empty parasite file ?
> How to erase this empty parasite file in CAF ?

You don't have to. Cubase manages it on it's own. You just have to use
this partition for CAF only. Don't use your CAF partition for general
use.

I seem to remember that if CAF crashes, then it won't free up the extra
file, and you may have to delete it yourself.

> What about the answer of Steinberg France,is there a virus ?

I don't think so.

That sounds like a lot. Have you loaded all the modules and everything ?
Any accessories, file selectors, alternative desktops, etc... ?

> I can no longer connect at all - it simply hangs up as soon as the ISP
>picks up the line. I'm back beyond square 1.

You are misinterpreting the results. The ISP does not hang up immediately,
but does so after your login attempt has failed, which it does for reasons
made obvious below.

----- snip ----- re: initial LCP option configuration (seems OK)

The 'problem' comes when PAP (Password Authentication Protocol)
attempts to identify you and verify your rights to login.

>LCP -> Link established, starting PAP & IPCP.

So far so good, but the 'problem' is in the packets exchanged for the
password verification below. I'll make it clearer for you by putting
the ascii characters below the significant ascii codes.

>PAP -> Doing Conf.-Request : (Id $18)
> [04 74 6f 6e 79], [0a 74 65 73 74 66 6f 72 70 70 70].
NB: t o n y t e s t f o r p p p

The above request means that you are attempting to login with
PAP_ID = tony
PAP_PASSWORD = testforppp

Now, you may indeed have the username "tony", but I strongly doubt that
your ISP has allowed you the password "testforppp". Assuming that they
have not done so explains the following response (and disconnect after).

>PAP -> Peer sends Conf.-Not-Ack. : (Id $18)
> [0d 49 6e 76 61 6c 69 64 20 4c 6f 67 69 6e].
NB: I n v a l i d L o g i n

The above naturally means that the ISP found your password unacceptable.

>LCP -> Link is going down.
>LCP -> Doing Term.-Request : (Id $19)
>LCP -> Peer sends Term.-Ack. : (Id $02)

And this was the PPP disconnect, soon to be followed by line disconnect.
All in very good order.

> Any more ideas? I'm dead in the water now.

How about entering your correct PAP_ID and PAP_PASSWORD into the dialer ?

Well.. I kinda made it come ;-) This is on my Hades 060, and I've been doing a lot of tests with different betas of minix.xfs/kernels and such. I must admit that I've not been nice to the system, so I wasn't very surprised when it happened, I just sweared a lot because I didn't keep a backup of the important files, like my in-box file. I had no problems getting the system uprunning again. I did manage to save most of the stuff on the partition, so I just minit'ed the partition and copied things back onto it.

Ah yes, I checked again.

It was http://www2.magmacom.com/~montreum/host.html I tried several
ftp sites without success, and did a file search on Hallvard's
launchpad for host.html. This didn't find it, but brought up a multi
search engine. I crashed on this, so gave up then. I probably don't
need it anyway, just that its nice to weigh up all the options,
before getting out the soldering iron, not forgetting the magnifying
glass. :-)

>----- snip ----- re: fitting the patch to a host adapter.

Martin recommended connecting the 5v +ve and ground from the power
supply to the hard drive. Do you think it would be OK if I made this
connection on the host adapter PCB?
<snip>
Thanks for your detailed explanation of TERMPOWER, it was
interesting, and will be useful to me.

From: ab453@cleveland.Freenet.Edu
Message-ID: <7gr4so$4hc$1@alexander.INS.CWRU.Edu>
Source record: 79250

Greetings!

We, the Atari Group, and other user groups here in the Cleveland Ohio area, are thinking of having a Classical Computer And Game Fair in 2000, late Spring.

We are looking for members of the following user groups, and they can also be from surrounding states:

Timex/Sinclair
Atari
Amiga
Commodore
Texas Instruments
Adam
Apple II
Tandy

And, video game users.

Our intent is that it be FREE to everyone, vendors and fairgoers, with seminars possible.

We are looking for helpers in the this, too.

Please email me if you are members of the above, are interested, can publicize for us, are just want to help!

Regards,

Jim W. Krych

2274. Okami: Faulty IDX file

Newsgroup: comp.sys.atari.st
Date: 1999-05-06 00:00:00 UTC
From: Nicholas Bales <bales@directprovider.REMOVETHECAPITALS.net>
Message-ID: <37313FE7.8837F29F@directprovider.REMOVETHECAPITALS.net>
Source record: 79252

Well, I'm still struggling with Okami. I upgraded to v2.0, and ran the CONVERT.TOS program, and it did work the first couple of times. The problem is that now, whenever I try to read email or a newsgroup, I get a "Faulty IDX file". It tries to correct it, then displays all the messages, each time I go back I get the same message.

When I go and look at the files, the IDX file has just disappeared. Because of this, Oimport can't find the IDX files and can't import new stuff.

Is this a bug or am I doing something wrong ?

I'll also add that I tried deleting all the newsgroup files and starting
all over again. First import was ok, but as soon as I started reading, I
got that same "faulty IDX file" message. This is on a Falcon, with NVDI,
Thing, STinG, News/Popwatch.

2278. GEAR FOR SALE!!

Newsgroup: comp.sys.atari.st
Date: 1999-05-06 00:00:00 UTC
From: "christian a. h." <godpup@ix.netcom.com>
Message-ID: <37314234.5502141F@ix.netcom.com>
Source record: 79256
Cross-posted to:
rec.music.makers.synth,rec.music.marketplace,rec.music.makers.marketplace,rec.music.makers,comp.sys.atari.st

Switching over to a completely computer based platform so I'm selling
most of my gear. Studio use only in a dust free and smoke free
environment...

Oberheim Matrix-6:
In perfect condition with copy of manual, supplementary 'guide,' and
about 1000 patches on atari formatted disks. (the casing of the keyboard
has a few stickers on it which can be removed..)
$475 obo Not including shipping

Korg DSS-1:
In perfect condition (yes, the disk drive works..) with manual and
technical specs. (also has a sticker on it which can be removed..)
$500 obo Not including shipping

Yamaha DX11:
Near perfect condition with manual. (three of the keys have slight
'chips' that aren't noticeable from above. covered up with white tape.
doesn't affect the functioning of the machine.. also has a sticker on it
which can be removed..) I'll include a keyboard stand with this as
well.
$325 obo Not including shipping

Roland R5 Drum Machine:
Near perfect condition with manual and power supply. (actually the
manual for the R8 which works fine with this unit..) I'll include an
Alesis Nanoverb II with power supply as well.
$300 obo Not including shipping

ART FXR Elite Processor:
Perfect condition with manual and power supply.
$150 obo Not including shipping

Alesis Midiverb 4:
Only a few months old. Comes with manual and power supply.
$250 obo Not including shipping

Alesis Nanocompressor:
Only a few months old. Comes with manual and power supply.
$70 obo Not including shipping

Tascam 424 multitrack recorder:
Only a few months old. Comes with manual and (new) blank tapes. Less
than an hour of use.
$350 obo Not including shipping

Atari 1040STfm Computer:
Comes with manuals, monitor, mouse and software. Upgraded to 4 Megs of RAM and TOS 1.04.(1.4) Atari Megafile HD (30 Megs) with HD Driver software. Cubase Score (registered version) with manuals and dongle. (latest and last version released for the atari..) Also includes X-oR notator / librarian, NVDI graphics driver, NeoGeo desktop replacement, Eureka cartridge clock and other 'maintenance' software. Everything's in perfect condition.
$380 obo Not including shipping

Sampling CDs:
Prosonus Drum Loops Volume I with insert. $35
Ilio Pitbull 'hardcore' d'n'b Loops with insert. $65
Both in perfect condition. Shipping included in the continental U.S.

I live just outside of Baltimore Maryland for reference..

cheers,

christian

I've been doing background downloading (often several different files at once)
using CABDLOAD since I got MagiC 5. It worked with CAB 2.5 and now with 2.7,
and I've only ever used Dan's OVLs. It didn't, however, work until I installed
MagiC. And by the way, it worked with STinG 1.15 and now with 1.20. But as I
said earlier, according to the CAB 2.5 manual, a multitasking system _is_
required to use the download module while running CAB.

>in using the non FPU versions.

Well, I never picked up an FPU - mainly due to the fact that it isn't used by many programs. But if CAB took advantage of it somehow, I'd buy one in a second. And I like your ideas about utilizing the DSP for GIFs and audio. But is anyone who could make this happen listening???

Alright, I might give that a try. But I just figured out another way to prevent the "disconnect-bomb". On my desktop, I have 2 different "dialer" icons - one of them connects to the ISP I pay for (using PPP), the other connects to a free SLIP server [a connection I really shouldn't have because it's a college I don't go to, but a friend did, and he realized you could get a SLIP connection through a sort of "back door"].

Now I realize you can load a different configuration into the dialer (which I've done) and then just dial the other ISP, but I find it quicker to have the two dialers set up (there are two separate DIALER folders/programs on my hard drive, each with it's own DIAL.SCR file).

Now for reasons unknown to me, I've found that hang ups are MUCH quicker when I disconnect from the SLIP server - almost instantaneous. I don't know why, but when disconnecting from my PPP server, it always takes a few seconds - and as stated before, often bombs. Well, haging up from the SLIP server _never_ caused these bombs, so now, even when I dial and connect with my PPP ISP, when I'm ready to disconnect, I just quickly load my SLIP dialer, and disconnect. It's instantaneous and bomb free every time!

So perhaps the STinG dialer disconnect bomb is related to using PPP somehow?

[snip]

(re: QED problems)

>Hmmm, maybe because of the Falcon? Never had probs with any QED (well, one

>CAB.

Well, it doesn't seem to matter if I leave POPwatch active or not. Currently, I pay for my [PPP] ISP by hours of usage (they had a good deal going for this, and often I only have time to get mail/newsgroups a couple times a week, so it works out for me). But things are changing (with my schedule and their rates) so I'll probably switch it to unlimited time with them soon. Anyway, my point is that I usually connect just long enough to get what I need, then disconnect, then answer e-mail and read newsgroups offline, then re-connect etc.

>If I get bombs with STinG when I do log off POPwatch or it happens
>anyway, I simply "tidy up" in MagiC and everything works fine again and
>I get no re-occurence of the bombs.

Hmm, never thought using "tidy up" with MagiC would allow the dialer to connect again. I'll give it a try next time it bombs.

I use MAGTOROM, but don't think I've tried MAGXBO32. I'll look for it, thanks.

>Now try BOOTCONF (v 1.32 again from Uwe's page) and set Boot delay to 0 secs.
>This will prevent the memory test (no need to hit a key to abort it).

Actually, I use a little program called BOOT TYME [it resides in the bootsector
of a floppy I keep in the Falcon's drive - it also disables the memory test
only it still takes a couple seconds, and shows it's own little "Boot Tyme"
screen. I'll look for BOOTCONF though.

>That's the tricky part! My experience with ICD drivers wasn't so good when

>Such as ?

Oh, just the usual AUTO folder/CPX/ACC stuff. Not really complaining here,
just stating that it takes a bit of time to boot up with all the things I use.

>I'd like to see a list of these AUTO folder programs...

Well here is what I usually boot up with when running MagiC (_NOT_ in this order):

TL.PRG
ACAF_FIX.TOS
DRVIN.PRG
EXTENDOS.PRG
FONTSEL.PRG
JPEGD.PRG
MAGTOROM.PRG

MAGXBOOT.PRG
NEMESIS.PRG
NEM_HI.PRG
NVDI.PRG
SCC.PRG
SLECTRIC.PRG
STING.PRG
VIDELITY.PRG
WDIALOG.PRG
XBOOT.PRG

Well, I'm 90% certain I had that fixed way back in 95 when I got my Falcon. I had an Atari dealer do all the required Cubase Audio mods, which as I understood it, included the "clock fix" (ie. SCSI patch). Perhaps I am mistaken though. Is there a test that will determine whether or not it was actually done?

>Finally, HD Driver is not likely the problem, other than it is FAST, and

I'm not really blaming HD Driver - it's just that on my particular system, ICD Pro works better. But I will certailny try HD Driver again with DMA "off" and see what happens.

>Make sure the SCSI bus is well termintated...

Always has been. However, I have often wondered if it matters how many SCSI devices are hooked up. I have a Seagate Baracuda HD, a SyQuest EZ Flyer 230, a Mediavision Reno CD ROM, and a UMAX 1200S scanner. I use quality cables, but perhaps the combined length of all my SCSI cables could be a contributing factor here?

That's the thing about ICD Pro. I would occasionally get a freeze up, but it would always resolve itself in 10-30 seconds. As far as why ICD Pro does this and why HD Driver doesn't is beyond me...

I don't understand. You can't rely on checking of DMA addresses in order
to detect errors. And there is no way to know in advance how long a
transfer might take. Please refer to the SCSI specification for details.

> What I said was that a similar problem can also occur that is dependent
> on a problem with some SCSI drives. So it is not *just* Falcon dependent.

I've never heard of SCSI drives that are broken this way. They would
simply be unusable for any platform, nobody would buy them.

Hi

I do know that Atari, in another fit of wisdom:p, did use another IC on
the keyboards! Maybe it was the first ST, as that had a completely
different type keyboard!

I also read that it was possible to replace the IC on the keyboards with
one that had more memory and can be programmed! For the life of me, I
can't remember which book it's in:(

>
>Also, does it matter if the hard drive is a SCSI or Megafile type
>drive?
>
>I have both for my STE, was just wondering if that makes a difference
>when doing a Floppy to File mode?

It shouldn't matter what type of drive you use as it uses standard file
transfer processes.

If you run it from folder, then the file created will be called
'MFMBTEMP' in the same folder as the DMFMBKUP.TOS file;)

I went through all the parameter files that came with it, and listed
them in alphabetical order and broke them up into 99 patches per files.
It took me ages to do, but gave me the ability to find a parameter I
need and if I had already got it in a print out.

If I've still got the files, IIRC in First Word+ format, send me your
parameter files and I'll check to see if they are the same. If they are
I'll send your the files and doc files so that you can print out; along
with my parameter 4 which contains parameters for more software, I've
added this. If they aren't the same I'll try and add it to what I have
and send you the docs when done;)

I may add a happy section to my web site;)

Nick, did you make a backup of the old bunch? If so, you could try to put
that one back and run Convert.ttp once more...
If it won't work I'd suggest moving back to the old version of Okami for
the time being.

I made a backup of my old stuff, then ran Convert and had no probs at all.
In fact I'm still under the impression that import/export/expire runs a
lot faster now, but I'm not sure whether that's because of the new IDX
stuff or the newer ttp's that came with it.

Paul,

it must be machine related... at least that's what I make of it.

I N-E-V-E-R had any probs with Sting.... apart from the bloody corruption
of Cache.dns and Route.tab at the beginning which came from Newsie.

I ran a SLIP connection for some time, then changed to PPP and there's no
probs at all. The only probs with Sting here were very occasional bombs on
my Mint setup. MagiC = never anything. Occasionally Newsie bombs out, I
get this #69 error, can even start Newsie again and proceed. The dialer
never bombed out here, not on one occasion.

Even since I recently adapted my loginbatch, using Spawner which kicks in
both Pop and Newswatch simultaneously plus the Batclk stuff, it just runs
flawless.

But, once again: I did experience trouble with a different autofolder
sequence, reason to start using Autoexec.bat. I had been experiencing
rocksolid operation and noted the auto order sequence, so I set up my
Autoexec.bat accordingly. Works just great... but it takes quite some time
just to get at it :-)

Well, I didn't back it up (1st bad move) and I even tried deleting
everything to allow O to create a new file structure from scratch (2nd
bad move), and still I get the same problem.

> Sure, it's by Patrice Mandin - it's none DSP though so it's very slow.

Not so sure, there are 4 Doomlike projects for Atari :

DEE : straightforward port of Doom, very very slow !
PMDOOM : port for the Falcon, using the DSP. Not finished yet, but
getting cooler and cooler.
Bad Mood : brand new engine, very fast, but not finished at all... :-(
Some guys still seem to be working on it secretly.
Running : not really a doom port, as it doesn't allow the use of WAD
files, but still a Doomlike.

Here are the urls I know :

PMDOOM : http://www.multimania.com/pmandin/
Bad Mood : http://rand.thn.htu.se
Running : http://www.atari-computer.de/rdt/home.html

Hi;

Yeah, what has already been posted should be all you need to do. If it doesn't work after doing these things, try turning on the drive first, wait for about 5-10 seconds, during which point you should hear a fluttering kind of noise from the drive. After this, turn on your computer.

I picked up a drive used a few years back, and no matter what I did, i couldn't get the computer to recognize it. I reformatted, tried to sneak in any way I could, but nothing. After three days and a lot of cussing, I got in touch with the guy I bought it from, and he told me to turn the drive on first, then wait. Sure enough...

Good Luck

->
->
-> Odd Skancke - ozk@atari.org

Well, I think all of us "MiNTer's" have been there, done that... ;-))))

BTW, how did you copy everything back over? From a standard TOS partition
to your MiNT partition? Did you have any problem afterwards? The reason
I'm asking is, I did basically the same thing when I changed hard drives,
but I had some scripts (1 really) stop working. I took an EZ-135 and made
a MiNT partition on it, with the same parameters as the MiNT partition on
my hard drive. I then drag 'n dropped from the Thing desktop, copying
everything over to the EZ cart. I installed the new hard drive, re-installed
my Minix partition using KEMD R2, then copied everything different back
over from the EZ cart. All was fine, except from my IP-DOWN file, which
sits in /etc/ppp and is supposed to run after you quit your ISP. Before the
move, it worked just fine. After, well...it just sits there and refuses to
run. I even went back and re-copied it, as well as checking its permissions,
to make sure it was identical. Whats strange is, I can run the file from
vcon and it works fine, does just what I've got it scripted to do...and
no errors... Any ideas? Thanks! ;-)

I'm trying to get my STE to print to a Hewlett-Packard 1100 laser printer. HP say that it should work with older Laserjet printer drivers, but it won't speak to me at all. It works fine with a PC and Windows (yuk), but won't do anything with my STE or Stacy. I've tried sending formfeed characters etc via the Tweaks PD programme; I've tried printing from desktop, via NVDI and from Notator - nothing. The print sequence on the ST goes as normal, but the 1100 doesn't even make a murmur. Has anyone got any tips please?

Have a look at the Ghostscript page:

http://www.cs.wisc.edu/~ghost/aladdin/doc/New-user.htm

Ghostscript is complex to set up and frustrating in that after an age of
a blank screen you can be greeted with a long list of errors, but when
it does work it prints PDFs almost as good as ADOBE. Ignore the fact
that it seems to look only for ps extensions, it will also load and
output pdfs to screen or printer or whatever. My experience is on the
Falcon, but should work on the SD. Works in full colour on the Falcon.

From: verklau <verklau@village.uunet.be>
Message-ID: <7gsj6a$j8o$1@xenon.inbe.net>
Source record: 79285

Hello Kevin,

Distressed, but my English is not very good. I use a translator.
To answer to your question, in 1992 I bought Notator 3.1 C-Labs and used it
on an Atari 1040 ste.
At the time of the transfer toward Emagic, I put back my donggle and
received a LOG3 to use the last version 3.2 of Notator and the newNotator
Logic.
In 1996, I passed on PC. I put back my LOG3 and received a PC pack with a
new donggle. Currently I use Logic Audio Platinum 3.6.
Nevertheless this program refuses to export some large midifiles (+ 200 ko),
what Notator made easily on Atari.
As I always have my Atari and the Notator disks, there is the reason why I
tried to use the program without donggle. I put the question because I know
that on PC it is possible.
If this is not possible on Atari, too bad.

Claude

You need to boot from a floppy with ICDBOOT.PRG in an auto folder on
said disc. If that doesn't see the hard disk maybe your host adaptor
has been zapped?

I am also not an expert, but I read the manual.
There is a menu function in the HDDRiver utility with 'error' in it.
That shows a box with the lastest SCSI error the driver has met.

2310. Re: STinG 1.20 - Where's the old TCP.ST

Newsgroup: comp.sys.atari.st
Date: 1999-05-06 00:00:00 UTC
From: Ekkehard_Flessa@wun.maus.de
Message-ID: <199905061622.a37367@wun.maus.de>
Source record: 79288

Hallo Ronald!

RA>AFAIK no one has ever been able to make the LAN port behave properly,

Well, at least PINGing over that port is working okay, but with several lost packets. Seems that the problems I first encountered were related to either a wrong setting in SCC.PRG or a bug in StarCall 3.0b3. I tried it with connect97 yesterday, and since characters would come through in both directions, set up STinG to use that port instead of midi.
[later]
Some more tries with connect97 resulted in the experience that any speed above 38k4 will cause lots of crc errors when transferring files with Zmodem, slowing down the transfer rates to around 100cps. 38k4 gives me a transfer rate of 3700 cps in both directions, but will randomly produce crc errors as soon as I move the mouse around on the receiving machine. So, setting the SCC port to 38k4/8/n/1/RTS/CTS should work.
Starcall didn't work again, so there must be a bug in there.

RA>One note though: LAN port pin 7, normally marked as 'Reserved',
RA>actually is connected to an input driver that feeds the DCD input of
RA>the SCC.

That might be useful for connecting a Modem to that port, but will not be of any use for connecting two of these ports together, since there would have to be a corresponding (and yet unused) output pin.

RA>If these are connected straightly between two units, then they
RA>both 'listen' to this input, with no one feeding it any signal. That
RA>seems nonfunctional to me.

You are right, but that's no worse than letting them unconnected, I suppose.

RA>I think that the HSModem LAN drivers are either bugged or lacking in
RA>their documentation. Just following normal instructions won't work
RA>for this.

Actually, I _did_ get a somehow working connection over the LAN ports.
Now I've the ports set to 38k4, and almost every ping will return. Well, at least as long as I do not touch the mouse on either one of the falcons :-(
Reducing speed to 19k2 will slightly improve reliability, but there are still numerous lost packets, visible also as "dropped" in the dialer's Statistics window.
[later]
I've now got a working setup. Falcons #1 and #2 connected through their LAN ports with 38k8, Falcon #1 and Milan connected with Modem2 and Serial 2 respectively and 57k6.

(Modem)--115k2--(Modem2+Milan+Serial2)--57k6--(Modem2+Falcon
#1+LAN)--38k4--(LAN+Falcon #2)

aFTP 1.42 on Falcon #2 will download files from the Milan (running ftp_serv
1.03 by Vassilis Papathanassiou) at around 1100cps. CAB 2.7 is slightly better,
reaching some 1500 to 1600 cps downloading the "cow.htm" files as provided with
CAB. Weblight 5.05 is acting as the web server.
I also tried surfing the www from all three machines at the same time. This is
working, too, but CAB 2.70 on Falcon #1 will bomb very often as soon as it
indicates data coming in. On Falcon #2, I was able to visit several pages but
finaly that machine crashed completely while waiting for data. So, things are
working but not as reliable as they should be.

mit freundlichem Gruï¿½ aus Ahornberg
Ekkehard

P.S.: MagiC Milan is finished (at last) and will be shipped these days,
according to www.milan-computer.de. So, hopefully, my copy will arrive soon and
I can continue testing with an alternative operating system. There are still
two weeks of holidays left :-)

2311. Demon Fax TIFF reader

Newsgroup: comp.sys.atari.st

From: rich@rjelwell.demon.co.uk
Message-ID: <926018126_OASIS_NEWS@rjelwell.demon.co.uk>
Source record: 79289

All,

My ISP, Demon, have a Fax to Email service and they are offering 12 months free trial to customers.

The only problem is that the fax is emailled as a TIFF picture file and I can't find a program for the Atari that will read it.

I have tried Gemview but it doesn't like it. Paint Shop Pro for the PC says the file is a Fax CCIT3 (or something like that).

Do any of you know of program that will view such a file or possibly convert it to another format such as GIF?

I am sure fellow Atari using Demonites would be interested in any help you could give.

Rich.

which version of NVDI are you running?

I ask this because a few months ago the club president and I were
preparing for the TAF demo of NVDI 5 and we were installing it on the
club machine for demonstration purposes (it's off now, don't worry). He
had recently gotten an HP LaserJet from a friend and was trying to get
it to work with his copy of NVDI 4, and was having similar problems to
what you were describing. NVDI 5 cured it. (He later found that
SpeedoGDOS 5 also allowed for printing from the LaserJet).

Hi

I've signed up for Demon's Dfax service. I haven't tried anything out
yet. IIRC Image Copy can handle TIFF's!

It's a pity you couldn't get it diverted to a fax machine when you go
on-line!!!

Imagecopy 4 or LooknSee will display and convert TIFF format pictures to
whatever format you will need.LooknSee can be download from the
Interactive website:http://www.cix.co.uk/~inactive/

I am not sure where you can get Imagecopy from...I am sure someone on here
will give you more info on this one.

> vcon and it works fine, does just what I've got it scripted to do...and
> no errors... Any ideas? Thanks! ;-)

Well, all I did was copy the savable files over to another Minix
partition. After fsck had done its job, the damaged stuff was gone (Well,
not quite, still available in the lost+found folder, but the stuff in
there was really messed up). After that, I used the newest minit (from the
minixfs-0.71 archive), and just copied the stuff back. All copying was
done with Thing 1.29 beta.

I can't say anything about your ip-down script, as I don't use this
script myself. Infact, I don't have a disconnect script at all. So, all I
can say is to check your options file in /etc/ppp or your .ppprc file in

your home directory. One of those files should have a line something like this;

disconnect "/bin/sh /etc/ppp/disconnect.sh"

In your case, disconnect.sh would become ip-down ...

Hope that helps

Odd Skancke - ozk@atari.org

Hi Ekkehard,

sorry to jump in here, but I can't get my modem to work from the LAN-port.
Some bloody idiot shoved a gfx card into the VME slot of this TT and
removed the flatcables plus serial sockets from the motherboard, instead
of leaving them in. So I've got no Serials.
I bought a (Maclike) LAN to Modemcable, but the modem does nothing on it.
(Yes, I set Sting and the whole bunch to Ser.2/LAN). So for the time being
I'm stuck on 38400 bps from Modem-2, but with my V90 I should be able to
go over that.

Any idea how to get this done from LAN? I know the other option is to
fabricate a new flatcable from the motherboard connectors to new sockets,
but if the LAN-port could do the trick I'd prefer that way.

I've been asking before, but appearently no-one in here is using the
LANport for modem connections...

Hi Richard,

I'm on Demon as well but can't help you... bloody problems with those TIFF files, why don't they provide GIF's or JPG, or even bloody BMP's?

TIFF IMO always has been a problem on Atari. I reckon there are too many TIFF-format versions, and appearently all not compatible. Have been trying lots of viewers and gfx programs, always the same stupid problems.
When I started to fetch weather pictures from sites, like analysis charts or upper atmosphere charts, I selected those sites which provided JPG or GIF output, not TIFF's. First of, TIFF's are bloody large, second, 99 out of 100 won't load in Atari programs.

Best choice to try 'n load TIFF's would be old Cranach, I think...

Try convincing Demon using different output format; it would save on transmission time too :-)

Not many Atari programs support CCITT3-compressed TIFFs besides the fax stuff. Photoline supports the format for loading, although that would an expensive viewer/converter. TouchUp supports the format as well, but I don't remember if it was just for saving as CCITT or if it could load them, too. I know Imagecopy 4.01 can't load them -- perhaps a more recent version can?

TIFF is the *native* graphic format for fax transmissions. Demon
provides them like this because that's how they receive them (and how
they're sent). It's just the CCITT3 compression that most Atari programs
can't handle.

BTW, I remember a service bureau had a special program that could read
over 150 variations of TIFF (most of which broke rules). But the fax
standard is very concrete -- one of the most popular graphic formats in
the world if you count all the fax machines in use.

2323. Help with 720k disk

Newsgroup: comp.sys.atari.st
Date: 1999-05-06 00:00:00 UTC
From: sheercon <sheercon@earthlink.net>
Message-ID: <3731B15C.F953387D@earthlink.net>
Source record: 79301

I have been trying to copy .st files on the PC (In emulation format)
over to DD 720k disks. The problem is, a lot of the .st files are larger
than 720k and I can't seem to format my DD disks for more than that.
Does anyone have any experience with this problem? Any help would be
appreciated... I think these games are better on a real ST as the
emulator seems to lose something in the "translation".

Thanks,
Brian

The Demon fax TIFFs are also multi-page, ie all the pages for the fax are in
the one file. This causes problems for a lot of viewers, but anyone with
Win95, 98 or NT is OK as there is a suitable viewer supplied with the OS
(it's used by MS Fax).

I don't know of an Atari program that works with that type of TIFF,
unfortunately.

Switching over to a completely computer based platform so I'm selling
most of my gear. Studio use only in a dust free and smoke free
environment...

Oberheim Matrix-6:
In perfect condition with copy of manual, supplementary 'guide,' and
about 1000 patches on atari formatted disks. (the casing of the keyboard
has a few stickers on it which can be removed..)
$475 obo Not including shipping

Korg DSS-1:
In perfect condition (yes, the disk drive works..) with manual and
technical specs. (also has a sticker on it which can be removed..)
$500 obo Not including shipping

Yamaha DX11:
Near perfect condition with manual. (three of the keys have slight
'chips' that aren't noticeable from above. covered up with white tape.
doesn't affect the functioning of the machine.. also has a sticker on it
which can be removed..) I'll include a keyboard stand with this as
well.
$325 obo Not including shipping

Roland R5 Drum Machine:
Near perfect condition with manual and power supply. (actually the
manual for the R8 which works fine with this unit..) I'll include an
Alesis Nanoverb II with power supply as well.
$300 obo Not including shipping

ART FXR Elite Processor:
Perfect condition with manual and power supply.
$150 obo Not including shipping

Alesis Midiverb 4:
Only a few months old. Comes with manual and power supply.
$250 obo Not including shipping

Tascam 424 multitrack recorder:
Only a few months old. Comes with manual and (new) blank tapes. Less
than an hour of use.
$350 obo Not including shipping

Atari 1040STfm Computer:
Comes with manuals, monitor, mouse and software. Upgraded to 4 Megs of
RAM and TOS 1.04.(1.4) Atari Megafile HD (30 Megs) with HD Driver

software. Cubase Score (registered version) with manuals and dongle.
(latest and last version released for the atari..) Also includes X-oR
notator / librarian, NVDI graphics driver, NeoGeo desktop
replacement, Eureka cartridge clock and other 'maintenance' software.
Everything's in perfect condition.
$380 obo Not including shipping

Sampling CDs:
Prosonus Drum Loops Volume I with insert. $35
Ilio Pitbull 'hardcore' d'n'b Loops with insert. $65
Both in perfect condition. Shipping included in the continental U.S.

If you think something is overpriced please feel free to make me an
offer.

I live just outside of Baltimore Maryland for reference..

cheers,

christian

2329. Re: Replacing Monaco font

Newsgroup: comp.sys.atari.st
Date: 1999-05-06 00:00:00 UTC
From: J WILKINSON <jwandjw@ihug.co.nz>
Message-ID: <3730AB24.BD8AB9A1@ihug.co.nz>
Source record: 79390

Hi there,

Maciej Rozmus wrote:
>
> I'd like to replace Monaco font (under NVDI) with something else like fonts
> supplied with Thing or Jinnee.
>
> I copied these fonts to GEMSYS folder and edited ASSIGN.SYS (manually and
> using ASSIGN.PRG). After reboot i get ... standard atari font.

ASSIGN.SYS will normally read something like this...

```
05P SCREEN.SYS
s MONACO08.FNT
s MONACO09.FNT
s MONACO10.FNT
s MONACO20.FNT
```

The 10 point system fonts are 4698 bytes in size. If your new font is not
that size it cannot be used to substitute for the MONACO10.FNT. Also, you
need to change the correct screen driver depending on the machine you run
NVDI on...

For STfm, STe, Mega ST, Mega STe, without graphics card, make sure ASSIGN
reads...assuming NEWFONT.FNT is your new 10pt system font...

```
01P SCREEN.SYS
02P SCREEN.SYS
03P SCREEN.SYS
04P SCREEN.SYS
s MONACO08.FNT
s MONACO09.FNT
MONACO10.FNT <= make sure the 's' is removed from infront of this
s NEWFONT.FNT <= your new font, put 's' infront of it to make it
s MONACO20.FNT the system font...
```

For Falcon030 machines, 05P SCREEN.SYS is where the changes go...

For TT machines, 06P, 08P, and 09P SCREEN.SYS are where the changes go...

I also have a German freeware program I can edit fonts, to have my own
weird looking system fonts!

Hope this helps,

Kind regards

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

I have'nt been following this thread to carefully so don't everybody yell at
once at this uneducated guess:
For my ISP and others I've subscribed to, I select active in the StinG
Protocol CPX (not Port) and leave STinG Port totally out of the picture
(as CPZ) with 0000 0000 Modem 2 0000 (Falcon port) in that script and tick
x in the dialer config. Using Port seemed to confuse my machine.

Hallo Ronald!

RA>Yes, and I think a misunderstanding by the module author could be the
RA>cause.

Do You mean the serial.stx module or what?

RA>he LAN port, after all, does not have any RTS output, it only has DTR
RA>as the outgoing handshake line. But the incoming handshake line is
RA>sent two ways, both to LCLK and to CTS. Ample room for
RA>misunderstanding I guess...

As Harun described in scc_x.txt, the HSMODA drivers will provide some kind of
hardware handshake, using DTR as RTS output and the incoming status line as
CTS.

RA>Again, this is typical for missing handshaking. Mouse movement steals
RA>CPU time from SCC interrupts, and without handshaking this leads to
RA>buffer full errors.

I've heard about some design error in the Falcon's layout, giving the mouse
interrupt a higher priority than the interrupt from the LAN port. Don't know
exactly, but that might be an explanation.
Downloding files via GSZRZ ZModem from a BBS (Modem attached to Modem 2 port)
will also produce crc errors when moving the mouse around, so I suspect that
the Falcon's interrupt handling is far from perfect :-(

RA>or the buffers are extremely small (like the default size).

I've set those to at least 4k or the like, should be sufficient for many
packets. And yesterday I inreased those buffers to 16k, but with no effect.

RA>Was WebLight also running on the Milan ?

of course, yes, as the Milan is the machine that is always in use and has
enough power (and RAM, and harddisc space) to operate some programs in the
background.

RA>No, that is definitely not acceptable. It appears to be a case of
RA>interrupt overload of some kind. This conclusion is backed by the fact
RA>that Falcon#1, using 2 ports, bombs much easier than Falcon#2, using
RA>only one port.

Well, there might also be some interference with the BNET stuff, which was also
running (but not working) at that time. The final crash of Falcon #2 looked
that way. I'll have to do even more testing to figure that out :-(

Hallo Louis!

L>I've been asking before, but appearently no-one in here is using the
L>LANport for modem connections...

Nor do I. I'm just trying to use the formerly unused LAN ports for networking
my Falcons with a Nullmodem cable.
As for your problem, there is some documentation in the german section of
scc_x.txt inside the HSMODA06/07 packages:

Wenn man die LAN(RS422/423)-Schnittstelle mit einer RS232 verbinden will,
als Nullmodem mit Benutzung von Hwhs, sollte man verbinden:
LAN RS232
HSKo CTS
HSKi RTS
TXD- RXD
TXD+ open(nc)
RXD- TXD
RXD+ GND
GND GND

The above is for connecting a LAN port and a normal RS232 port via Nullmodem
cable. For connecting a Modem, it should look similar to that, but without the
"crossed" lines.

Hope that helps.

Hallo Ronald!

RA>2: On a MagiC system you always need both BNET.APP and BNET.XFS
RA>3: On a singleTOS system you only need BNET.APP, but must use it as
RA>BNET.ACC

and what about a MiNT system like my Milan? The xfs won't work here, I'm afraid
:-(

RA>Why just one ? If it was entirely due to BNet it should have bombed
RA>both.

I thought so, but that's not what I experienced. These Falcons are not entirely
identical. Operating system and most Auto Folder programs are, but not memory,
CPU speed and Screen Resolution Enhacement Hardware+Software.

RA>As discussed in other mail, I don't think that the LAN ports are safe
RA>to use with current HSModem modules.

I'll test it some more times, but I'm sitting far too long in front of these
crt displays :-(

> settings of MTU=1006 (as per my ISP), 0.0.0.0 for IP settings and Active
> box selected.)

same, except I go in here to make sure the setting is NOT active. as
very often it is
active, even though i have made it inactive and selected SAVE. this is a
puzzle.

> I go to STinG Internals in the Control Panels and ensure the Active box is

I connect just fine as well.

> LOGIN.BAT is activated as per the script and the message 'success' is
> displayed. My ISP has confirmed that I am making the proper connection
> and am online via PPP.

i have login.bat disabled in my dial.scr

> Starting CAB (using the ovl obtained from Dan's site), I get the message:
> can't resolve hostname.

I get can't resolve hostname for just about everything I try. At first I
was using
different e-mailers (amail, antmail, newsie, ...) to try and get my
mail, but ALL of
them reported DNS error-could not resolve hostname, so then I figured
STing is the problem.
Now I just use the tools in dialer.acc to check my connection
pinging my ISP gateways, hostnames. etc give me good replys
pinging known numbers (i.e. my works ISP) give me good replys

however, using the "Resolver" tool, i cannot resolve my ISP's named web addresses
I also cannot resolve any web address I can think of.

> Leaving CAB (after it unlocks - about 30 seconds later - sometimes
> disconnecting me and hanging up the modem), I start Telnet. Telnet

>"N-E-V-E-R" had any STinG disconnect-bomb problems? Which is it?
>

Hi Paul,

actually, when I read back my msg when it came in, I thought about the
same.
Let me explain: I DID have the Dialer bombing out here. The problem was:
wrong autofolder sequence. At the same time I had more apps bombing out,
or the system being screwed up so the bloody Memory violation msg turned
up, forcing you to use the resetbutton.
All in all this ONLY turned out to be caused by a different sequence in
the autofolder. Once this is set right (and you only get it right by
experimenting, reading "readme's" about programs that wanna be first,
last, in between or whatever and next finding a solution to please them
all and at the same time keeping bombs from the screen. Not an easy task,
it took me around a year to get it where it's at right now: rocksolid).

So in the end I can say: under those circumstances the Dialer and most of
my apps never bomb out. Very occasionally Newsie displays a 69 error, next
I start it up again and proceed. And still I do have some
"schweineprograms" here, like Liberty/Freedom, and under Magic my old
(1.97) Wdialog is running.

One can also say: the Dialer bombs also when other apps bomb out regularly.
In fact I don't consider that a Dialer problem. It's a setup problem.

Hope this clears a bit :-)

Are you certain that you have the jumpers properly set on your hard drive, the ribbon cable properly installed and SCSI terminators installed on both the first and the last devices in the SCSI chain? Those are the usual causes of the system not seeing the drive. Other than that, have you tried using the ICD software drivers instead of HD Driver?

/etc/ppp/ip-down is not really a disconnect-script, it's a script (or
binary) that's called by pppd after a session is shut down. Since the
problem appeared after a copy, I suspect that the script's x-bit isn't
set, so try change that either with chmod or Thing.

As I mentioned in a previous posting, I have tried EVERY combination
including the device on it's own.

The ICD software find it, no problems at all, but HD Driver doesn't:(
and I prefer HD Driver over the ICD one as I can move devices between ST
& pc!

Hello Joe,

I was hoping that maybe some archiving will be carried out quicker, but maybe
it won&#65533;t gain any speed increase from the presence of a FPU? And the
conversion of images in eg. CAB?

Anyway, I guess that the expansion slot you are talking about and the Mega Bus
is the same thing? Are there other utilities that can be fitted in it? What
about graphic cards? Whats the cost?

Oh, almost forgot, how much would your FPU-board cost?

Regards,

Joakim

Atari games are hard to find, and some of the ones I've seen on Ebay are more expensive than when they were brand new. I had an Atari years ago and have already purschased all the games I want to play anyway. I gave all my atari stuff away years ago and just want to play some of those old games again.

Your problem is really related to the fact you are somehow using old
IDX's. I've had this too simply because Jos hadn't include the convert.tos
in his beta package. Once I ran convert.tos everything was normal.

I was thinking of picking up the 5v supply from the 30 pin
connector that plugs into the mother board, once I've determined
the pin no's. If anyone knows the ID for these it would be helpful.

I don't have a CT2 (I'm one of those who paid twice as much for an Afterburner two years ago...), but I can tell you that it's not compatible to either Nemesis or Nova. The Nemesis won't work simply because the CT already has speeded up the bus to 25MHz, and the Nova because the current run of CT2's don't have a through-port for the Falcon expansion-slot.

The lack of this port is very bad news, because this means that you can't install any graphics-cards later on :-(IMHO a very bad move by Centek. Apart from this (and the pathetic low RAM-limit) the CT2 appears to be a very solid and nice accelerator.

Photoline v2.30 supports fax TIFFs but v2.25 doesn't. TruePaint also
supports the format. But I have no idea how these programs handle
multi-page faxes.

If all else fails in your attempts to convert these faxes, you can do
them online via:

Image Alchemy: Free Image Conversion
http://www.handmadesw.com/hsi/web_alchemy.html

Group 3 and Group 4 fax conversions are supported.

I just downloaded CentView but I cannot get it to load any file at
all. Any jpg, gif or tif I gave it just caused a message, in French,
to appear which I guess meant I won't/can't load this. 16 colour img
files that come with 16 caused CentView to crash the whole machine.

Perhaps CentView doesn't like my Afterburnered Falcon :-(

Rich.

Hi, yes it is easy to setup!
But for now, you can grab version 2.1 in English off the interactive site
and get familiar with it..

2378. CD Rom driver for MagiC?

Newsgroup: comp.sys.atari.st
Date: 1999-05-07 00:00:00 UTC
From: jfhaslam@zetnet.co.uk
Message-ID: <373374cd$0$489@news.zetnet.co.uk>
Source record: 79235

Hi all!

What's the best CD Rom driver thats compatible with MagiC 6 on a Falcon?

I've just bought a CD Rom that'll come with Extendos, but I know that
there are other drivers around, such as Spin!.

Opinions please! :)

Cheers!

James

2381. FS: Mega STe w/ LOTS OF STUFF

Newsgroup: comp.sys.atari.st
Date: 1999-05-07 00:00:00 UTC
From: menethoran@aol.com
Message-ID: <19990507195054.22406.00000713@ng-fu1.aol.com>
Source record: 79238

Hello all,
Currently I am putting up my Mega STe.
I hate to see it go, but I have to for the money.
It has.
Mega STe board w/ 4 megs RAM mounted in full size tower case.
PC Power supply adapted to work with MSTe connector
Seagate Hawk 1.2 gigabyte SCSI hard drive, chock full of software including
MagiC 6.0
NVDI 5.0
SC1224 monitor in good condition.
ICD Link/2 Special clear edition (mounted internally)
Mega ST keyboard included

The tower modification I did myself. Currently some of the stuff just sits in
there but I will mount it up much more professionally if I get an offer. It is
a beastly system that I paid over $500 to put together in '94.
So if I get an offer you'll have to give me a week or two to set it all up real
nice. There is a spare power connector for a SCSI internal cdrom as well.
This machine is a keeper. I just plan to buy a falcon.
I was hoping to get $300 which would include shipping costs (so like $280).
Let me know

>Opinions please! :)

I'm currently using SPIN myself under MagiC 5.11, and find that it is very stable. In fact, I find that it can read a number of CD-ROMs that crash the system under ExtenDOS. The only problem I'm finding, though, is when I run the record off CD option in CDPlayer, that it records everything very jumpy - that's where ExtenDOS comes in and where it shines.

BTW, I just bought a new Toshiba 40x speed for my system - and I'll probably be writing a review on it for an upcoming Atari Computing. Not only is it faster, it's also opened up some interesting new compatability stuff for Atari users - for one thing, I can now read the software tracks on the Enhanced CD format music CDs! You'd be amazed to find out what I've found on my Sarah Mcclachlin and Primus CDs :)

2384. SMPTETrak Hybrid Arts problem on MegaST2! HELP!

Newsgroup: comp.sys.atari.st
Date: 1999-05-07 00:00:00 UTC
From: jr <JamesBRey@aol.com>
Message-ID: <3733B7E4.3897@aol.com>
Source record: 79241

Folks,

Just sold my Atari Mega 2 to a fellow who needs it to use Hybrid Arts SMPTEtrack.

He was running SMPTEtrack on a 520ST and now he has the Mega 2.

When trying to boot SMPTETrack on the Mega he is getting a memory error about not enough memory but it runs fine on his 520.

I tried disconnecting the HD and it booted okay on the Mega 2.

What is it about the ICD drivers on the HD or whatever else you can think of that would make this happen. Could it have something to do with disk cacheing or some other parqameter in the ICD drivers?

I believe SMPTETrack should run just fine on 1MB so I can't understand what the problem is except for something in the ICD HD drivers or whatever.

Any help or comments would be appreciated.

Thanks.

JamesBRey@aol.com

2385. Personalizing my system

Newsgroup: comp.sys.atari.st

From: "Thomas J. Andrews" <tandrews16@delphi.com>
Message-ID: <h9aZbMQ.tandrews16@delphi.com>
Source record: 79242

While I've been using 8-bit Ataris since 1985, it's only been the last six months or so that I've been a serious ST user. A friend from our former user group days has given me all his Atari equipment, now that he's moved on Macintosh. (His loss.)

The main system is a Mega ST4 with switchable TOS 1.4/2.06, a Toadfile 44 drive, nine hard drive cartridges, an SLM804 printer, and SC1224 and SM147 monitors. I've been spending all winter learning about it and what it can do, and I have a couple of questions.

The previous owner was very involved in DTP, and I'm well-supplied with programs in that area. His favorite word processor was Word Perfect, but I'm not so sure it's the one for me. For simple text writing for email and such, things I don't expect to print out, I use Edit Plus 3.12. I used AtariWorks for a couple of letters and to help in a small way with my taxes, and I really like the WYSIWYG display. SpeedoGDOS is positively awesome, especially with the 50 extra Bitstream fonts--even on my old Epson 9-pin printer, and the ability to pass information between modules is _very_ useful. I've used PageStream, too, and while it's dificult to work with columns in AtariWorks, it couldn't be much easier with PageStream.

So tell me--What can Word Perfect do for me that the above programs can't?

TJ

Here's a repost of my message from last weekend for those who might have
missed it. Less than 24 hours left to check it out and place a bid!

I'm finally letting loose of over a decade long collection of Atari ST
hardware and software. A Mega ST4 with HD and a 1040STf. DTP package with a
hand scanner. MASSIVE amounts of the best commercial software. All original
with disks and manuals. Games, programming languages, music programs,
educational, a bit of everything
Its all listed on eBay
www.ebay.com

Search in Computers for "Atari ST" or do a Seller Search for "beesmart".

Happy Bidding!

Hey... Thanks a lot!

Actually I was thinking just recently of resurrecting Gilgalad (which
was freeware btw) from its GfA-BASIC ashes. Time to dig out one of my
Ataris, reclaim my SM124 from a fellow former ST user and search for the
source. Hmmm, X-plat C(++) code or Java that's the question...

Markus

Get files:

hplj_cpx.zip
hpexpl15.zip

from ftp.cs.tu-berlin.de.
Both programms were prepared for HPLJ4L but IMO they should work with
HP1100 also.

If you are interested I can send to you a 1ST WORDPLUS driver for HP-
LJ4L. I use this driver sometimes when printing with HP-6L.

Louis,

I am surprised that the sockets were removed - they are soldered to the
board. IIRC you need to enable the lan port in HSModem.

Agreed, but this time I think Martin's info should contain all you need,
as long as you reinterpret some of it for how you want to fit the patch.

> before getting out the soldering iron, not forgetting the magnifying
> glass. :-)

I know what you mean. Those damn SMD chips of the MSTe interface are a bit
tricky to patch, and I had to do a lot of it on my unit, since I also added
some other stuff.

But for the parity patch most connections are to the SCSI bus, which is easy.

>>----- snip ----- re: fitting the patch to a host adapter.
>
> Martin recommended connecting the 5v +ve and ground from the power

Do you mean that you would be powering the hard drive this way ? Why ?
Doesn't your MSTe already have a power connector for a hard drive ?

> Do you think it would be OK if I made this
> connection on the host adapter PCB?

That depends on exactly what you mean above, and of course on _how_
you would make the connection.

><snip>
> Thanks for your detailed explanation of TERMPOWER, it was

----- snip ----- re: using two separate dialers for two separate ISPs

This is a perfectly valid way to select and dial the chosen ISP with a
minimum of fussing about. Sure, it wastes some space, but that's up to you.

>Now for reasons unknown to me, I've found that hang ups are MUCH quicker when I
>disconnect from the SLIP server - almost instantaneous. I don't know why, but
>when disconnecting from my PPP server, it always takes a few seconds - and as
>stated before, often bombs.

SLIP protocol has no disconnect procedure, so we just drop DTR. That's fast.
PPP protocol has a required disconnect procedure, which takes some time and
is subject to possible bugs (like any other code). Only after the procedure
has completed is it legal to drop DTR, so it is always slower than SLIP.

>Well, haging up from the SLIP server _never_ caused these bombs,

That's sort of obvious, knowing the above. Less complexity == less bugrisk.

>so now, even when I dial and connect with my PPP ISP, when I'm ready to
>disconnect, I just quickly load my SLIP dialer, and disconnect.
>It's instantaneous and bomb free every time!

Ok, I guess that's an acceptable workaround for those who have this problem,
provided that it gives no problems in repeatedly dialing the PPP ISP. I'm
not sure, but an 'incomplete' PPP disconnect could cause some problems here.

Hmmm, but I guess the port driver might be reinitialized by the dialer at
each new dialup, in which case there should be no problem at all. Can you
please test this a bit and then report results again.

I myself see those bombs very rarely though. Usually PPP disconnect works.
This could possibly be ISP dependent, so that some unexpected response from
the ISP triggers a bug in the PPP disconnect code of STinG.

>So perhaps the STinG dialer disconnect bomb is related to using PPP somehow?

That does seem to be the case.

>Yann Lossouarn

A slight correction is needed here:

Patrice Mandin has worked on two entirely different Doom clones !

One is of course the one you mention Yann, which uses the DSP but is not
even near completion. Like Bad Mood, it is not a game yet, just a kind
of 'walkabout' 3D world demo, using WADs for the world's definition.

The other is a 100% port (except for networking) of the original Doom engine.
This is a fully playable game, apparently improved to be able to handle all
Doom and Doom II WADs. Enemies are alive and deadly. In fact they seem a
lot more aggressive and intelligent than the ones I've seen in Jaguar Doom,
being more prone to come looking for you if you make unnecessary noise.
(And I only have a shareware Doom 1 WAD to test it with...)

But of course, on a standard Falcon this version is not really playable due
to the low speed. On my CT2B-Falcon however, it runs very well indeed, even
when I set maximum screen size and high quality display. I can still run
around with speed similar to that of Jaguar Doom. No sound though :-(

The thing to remember in looking for this engine is that it has a _lower_
version number than the latest version of the DSP-based clone, even though
that has lesser functionality. That's because they really are two different
projects, so their version codes are unrelated. Both clones were available

at the same site when I checked recently. (At URL given above.)

>Hallo Ronald!

Hi Ekkehard,

----- snip ----- re: your use of LAN ports with lost packets and CRC errors

This is quite typical of serial lines without hardware handshaking.
Did you try huge reception buffers ? Such should eliminate some of
the errors then.

----- snip ----- re: higher speeds => lots of errors, some mouse sensitive

Again, this is entirely typical of running without hardware handshaking.

>So, setting the SCC port to 38k4/8/n/1/RTS/CTS should work.
>Starcall didn't work again, so there must be a bug in there.

Yes, and I think a misunderstanding by the module author could be the cause.
The LAN port, after all, does not have any RTS output, it only has DTR as
the outgoing handshake line. But the incoming handshake line is sent two
ways, both to LCLK and to CTS. Ample room for misunderstanding I guess...

>RA>One note though: LAN port pin 7, normally marked as 'Reserved',
>RA>actually is connected to an input driver that feeds the DCD input of
>RA>the SCC.
>
>That might be useful for connecting a Modem to that port, but will not be of

Yes, that was what I meant. Connected straightly to another LAN port it can
not fill any function.

>RA>If these are connected straightly between two units, then they
>RA>both 'listen' to this input, with no one feeding it any signal. That
>RA>seems nonfunctional to me.
>
>You are right, but that's no worse than letting them unconnected, I suppose.

Agreed.

----- snip ----- re: working LAN connection, but with heavy 'losses'

Again, this is typical for missing handshaking. Mouse movement steals CPU
time from SCC interrupts, and without handshaking this leads to buffer full
errors. But this effect should not be so strong, unless the CPU is heavily
overloaded, or the buffers are extremely small (like the default size).

>working but not as reliable as they should be.

No, that is definitely not acceptable. It appears to be a case of interrupt
overload of some kind. This conclusion is backed by the fact that Falcon#1,
using 2 ports, bombs much easier than Falcon#2, using only one port.

>P.S.: MagiC Milan is finished (at last) and will be shipped these days,

I'm afraid that's not what we need here.
We were talking of the kind of error where the SCSI bus itself locks up,
so that nothing is transferred though a DMA transfer has been started.
In this condition no error codes can arrive from the drives.

I was arguing for a better method to detect this state than just using
a raw three-minute timeout. Such an improvement should then make it
safe to decrease the timeout to a tolerable lenght.

Hi Brain and Ekkehard,

Here are some useful facts about BNet:

1: BNET206B.ZIP is now available in my STinG pages.
2: On a MagiC system you always need both BNET.APP and BNET.XFS
3: On a singleTOS system you only need BNET.APP, but must use it as BNET.ACC
4: Unfortunately some problems can still occur in singleTOS usage
5: BNET.XFS needs BNET.INF in the same folder == C:\GEMSYS\MAGIC\XTENSION\
6: BNET.APP needs HOSTS.INF in the same folder == MagiC's APPS folder
7: BNET.ACC needs HOSTS.INF in the same directory == C:\
8: HOSTS.INF must be edited, to indicate machines local BNet should 'know'
9: Unlike some servers, BNet can not serve a call from the same machine,
so HOSTS.INF should be different for each machine in the LAN

>Well, the last time I tried it (Version 2.05), it just bombed one of my Falcons
>into the ground. No go at all, as soon as the xfs was installed.

Why just one ? If it was entirely due to BNet it should have bombed both.

>[some time later]
>I tried it again, this time having the two Falcons tied together via their LAN
>ports. Still no go.

As discussed in other mail, I don't think that the LAN ports are safe to
use with current HSModem modules. I suggest you try over Midi instead.
I know it's not as fast, but it works pretty well for most people.

>to detect errors.

That was not what I meant above, in fact I really meant the opposite.
Checking the DMA addresses, which are autoincremented during a transfer,
can prove that the bus has _not_ been locked up during the entire timeout.
Proof of non-error is just as valuable as proof of error would have been.

The implementation could work something like this:

1: At timeout start, the DMA pointer value is copied to a pointer in RAM.
2: If the full DMA transfer is completed, then the timeout is just aborted.
3: At timeout, the current DMA pointer is fetched (Note_1, further below).
4: The fetched pointer value is compared to the pointer in RAM from step 1
5: If they differ the bus is not frozen, so we go to step 1 to restart timeout
6: Here we accept the timeout, because the bus does seem frozen.
7: And so we generate a SCSI RESET to release the bus again

The above procedure shows how to avoid those very same potential problems
that you warned against earlier, that could arise from using CAF_FIX. In
most cases of a long transfer some data will have been transferred during
the timeout period, and for each such case the above procedure will prevent
an unnecessary and possibly harmful SCSI RESET from being generated.
It may not help in _all_ cases, but it will help in _most_ cases.
As I see it that is reason enough to implement it.

That does mean that there is less risk of any harmful effect from using the
shorter timeout. In fact, for cases where there is only one SCSI controller
involved (surely 99% or more of HDDRIVER users) I see no reason why the
timeout could not be even shorter than 30 seconds.

>And there is no way to know in advance how long a
>transfer might take. Please refer to the SCSI specification for details.

I understand that SCSI arbitration may affect this sort of thing, but I
really don't think very many HDDRIVER users actually use that, And if
some do, then it would be dead easy to raise the timeout value based on

the SCSI arbitration activation flag. The large numbers that do not use it,
could then benefit from a shorter recovery time, without affecting those
who do use it. (If you meant some other part of SCSI spec, state which.)

>> What I said was that a similar problem can also occur that is dependent
>> on a problem with some SCSI drives. So it is not *just* Falcon dependent.
>
>I've never heard of SCSI drives that are broken this way. They would
>simply be unusable for any platform, nobody would buy them.

The drives are _not_ broken. And they do not lock the bus spontaneously.
It is just that if a program is aborted, or bombs, or some other weird thing
happens while reading a file, then some drives are prone to fail to recover
from this, locking up the bus. And that sort of thing still happens now and
then under MagiC. (I like MagiC, but it does have some remaining problems)

Some drives seem to recover from such things every time, no problem, but some
don't recover until they receive a new SCSI RESET, and until that time they
can lock up the bus. That is what they have in common with the Falcon bug.
This does not make them useless, just a bit unpleasantly sensitive, and the
situation would be improved for the users with a shorter recovery time.

Note_1:

Naturally the split-bytes format of the DMA pointer makes the reading of it
rather special, since the pointer can continue being incremented between the
accesses that read different parts of it. Therefore such a pointer must
be read in a special way, to avoid erroneous result when a carry occurs
from one byte level up to the next. Otherwise the combination of the bytes
can produce a false value.

One easy way to get a correct value is like this:

```
TT_SCSI_DMA_ptr = $FFFF8701
get_tt_dma_ptr:
move.l sr,-(sp) ;push SR, for interrupt mask
ori #$0700,sr ;disable interrupts
lea (TT_SCSI_DMA_ptr).w,a0 ;a0 -> highest DMA pointer byte
.loop:
movep.w 4(a0),d1 ;d1 = pointer value low word
movep.l 0(a0),d0 ;d0 = pointer value
eor.w d0,d1 ;d1 = differing bits of low word set
and.w #$FF00.d1 ;was there a carry from low byte ?
bne.s .loop ;if so, repeat (next attempt will succeed)
move.l (sp)+,sr ;pull SR, for interrupt mask
rts ;return with d0 a valid recent pointer value
```

The above example is for TT SCSI.

If the same is to be done for ACSI, the 'DMA_ptr' address changes to
$FFFF8607, but since the first of the bytes fetched then is not part
of the pointer (it only has 3 bytes), it should be masked out before
the 'rts', by the instruction 'and.l #$00FFFFFF,d0'.

I'm not exactly sure where the Falcon registers are, but since a standard Falcon only has 24 address bits I suppose that the latter method, or even a hybrid of the two methods above can be used.

Agreed, but this time I think Martin's info should contain all you need,
as long as you reinterpret some of it for how you want to fit the patch.

> before getting out the soldering iron, not forgetting the magnifying
> glass. :-)

I know what you mean. Those damn SMD chips of the MSTe interface are a bit
tricky to patch, and I had to do a lot of it on my unit, since I also added
some other stuff.

But for the parity patch most connections are to the SCSI bus, which is easy.

>>----- snip ----- re: fitting the patch to a host adapter.
>
> Martin recommended connecting the 5v +ve and ground from the power

Do you mean that you would be powering the hard drive this way ? Why ?
Doesn't your MSTe already have a power connector for a hard drive ?

> Do you think it would be OK if I made this
> connection on the host adapter PCB?

That depends on exactly what you mean above, and of course on _how_
you would make the connection.

>to detect errors.

That was not what I meant above, in fact I really meant the opposite.
Checking the DMA addresses, which are autoincremented during a transfer,
can prove that the bus has _not_ been locked up during the entire timeout.
Proof of non-error is just as valuable as proof of error would have been.

The implementation could work something like this:

1: At timeout start, the DMA pointer value is copied to a pointer in RAM.
2: If the full DMA transfer is completed, then the timeout is just aborted.
3: At timeout, the current DMA pointer is fetched (Note_1, further below).
4: The fetched pointer value is compared to the pointer in RAM from step 1
5: If they differ the bus is not frozen, so we go to step 1 to restart timeout
6: Here we accept the timeout, because the bus does seem frozen.
7: And so we generate a SCSI RESET to release the bus again

The above procedure shows how to avoid those very same potential problems
that you warned against earlier, that could arise from using CAF_FIX. In
most cases of a long transfer some data will have been transferred during
the timeout period, and for each such case the above procedure will prevent
an unnecessary and possibly harmful SCSI RESET from being generated.
It may not help in _all_ cases, but it will help in _most_ cases.
As I see it that is reason enough to implement it.

That does mean that there is less risk of any harmful effect from using the
shorter timeout. In fact, for cases where there is only one SCSI controller
involved (surely 99% or more of HDDRIVER users) I see no reason why the
timeout could not be even shorter than 30 seconds.

>And there is no way to know in advance how long a
>transfer might take. Please refer to the SCSI specification for details.

I understand that SCSI arbitration may affect this sort of thing, but I
really don't think very many HDDRIVER users actually use that, And if
some do, then it would be dead easy to raise the timeout value based on
the SCSI arbitration activation flag. The large numbers that do not use it,
could then benefit from a shorter recovery time, without affecting those
who do use it. (If you meant some other part of SCSI spec, state which.)

>> What I said was that a similar problem can also occur that is dependent
>> on a problem with some SCSI drives. So it is not *just* Falcon dependent.
>
>I've never heard of SCSI drives that are broken this way. They would
>simply be unusable for any platform, nobody would buy them.

The drives are _not_ broken. And they do not lock the bus spontaneously.
It is just that if a program is aborted, or bombs, or some other weird thing
happens while reading a file, then some drives are prone to fail to recover
from this, locking up the bus. And that sort of thing still happens now and
then under MagiC. (I like MagiC, but it does have some remaining problems)

Some drives seem to recover from such things every time, no problem, but some
don't recover until they receive a new SCSI RESET, and until that time they
can lock up the bus. That is what they have in common with the Falcon bug.
This does not make them useless, just a bit unpleasantly sensitive, and the
situation would be improved for the users with a shorter recovery time.

Note_1:

Naturally the split-bytes format of the DMA pointer makes the reading of it
rather special, since the pointer can continue being incremented between the
accesses that read different parts of it. Therefore such a pointer must
be read in a special way, to avoid erroneous result when a carry occurs
from one byte level up to the next. Otherwise the combination of the bytes
can produce a false value.

One easy way to get a correct value is like this:

```
TT_SCSI_DMA_ptr = $FFFF8701
get_tt_dma_ptr:
move.l sr,-(sp) ;push SR, for interrupt mask
ori #$0700,sr ;disable interrupts
lea (TT_SCSI_DMA_ptr).w,a0 ;a0 -> highest DMA pointer byte
.loop:
movep.w 4(a0),d1 ;d1 = pointer value low word
movep.l 0(a0),d0 ;d0 = pointer value
eor.w d0,d1 ;d1 = differing bits of low word set
and.w #$FF00.d1 ;was there a carry from low byte ?
bne.s .loop ;if so, repeat (next attempt will succeed)
move.l (sp)+,sr ;pull SR, for interrupt mask
rts ;return with d0 a valid recent pointer value
```

The above example is for TT SCSI.

If the same is to be done for ACSI, the 'DMA_ptr' address changes to
$FFFF8607, but since the first of the bytes fetched then is not part

of the pointer (it only has 3 bytes), it should be masked out before
the 'rts', by the instruction 'and.l #$00FFFFFF,d0'.

I'm not exactly sure where the Falcon registers are, but since a standard
Falcon only has 24 address bits I suppose that the latter method, or even
a hybrid of the two methods above can be used.

: Hi Brain and Ekkehard,

: Here are some useful facts about BNet:

<snip>

Aye...it all works quite well here.
I use Midi to link a Mega 4 and Falcon 030.
Both running MagiC.

I've modems on both, and had some confusion setting up masquradeing, but it all works very well now ;)

I do wonder one last thing however...
Since plugging in the MIDI.PRG drivers for DRIVIN.PRG, I wonder optimal values to set for the driver. It is currently set 256/256, or whatever the default value in the package was. I use a MTU of 1500. It works fine, but I just wonder if some other setting might not be more 'optimal'.

Oh, and one last couriosity...
Is it possible to set up a gateway from the internet to machines on my LAN that aren't connected via the modem. I.E. I use the Falcon to dial in, and can have users connect to the falcon via the dynamic IP that is issued (and masked of course to whatever I'd set) at dial up. My ISP also gives a valid dns for that assigned IP, alla user091.localink4.com which can be used to attach to my falcon...but what if I wanna pipe it off to the Mega on down the LAN? I.E. run ftp_server on both machines, and get at either one from my job at school? Well...yeah, I know I could just pop symbolic links in the valid ftp path and pull them across with BNET, but I'm thinking further down the line...like when someone comes up with a way to telnet into a shell and actually run some things on the Falcon remotely.

Oh...one last last thing to point out (promise, this 'really' is the last).

I noticed that with MagiC 6.1, if I try to pull a file over the BNET using the file selector (K:/MYFALCON/Cx/path/file)
alla, into MGEDIT, or NEWSIE, or whatever I've tried so far...the app will bomb and exit. The good news is, I found a way around it.

Example:
I wanted Newsie on both machines, but with one central MAIL folder located an the Falcon (e:/usr/bjr/mail). When I'd set up newsie to grab this path using the file selector, it simply crashed and exited (this is using the setup paths dialoge in newsie to K:/MYFALCON/Ex/usr/bjr/mail. However, I was able to make a symbolic link on a partition of the mega to the mail folder on the Falcon via BNET and it works fine that way.
I.E.
I opened MYFALCON/path/mail, and held the alt key as I drug the mail folder over to a partition on the Mega. Note I did this from the Mega Console...I notice that I couldn't create a symbolic link on the Mega from the Falcon or vice verse. So....if you wish to create symbolic links across the LAN, you need to be working with the machine the link will be installed on. My guess is that BNET doesn't yet understand how to send, recieve, or both send/recieve a symbolic link command yet.

Finally, I set NEWSIE to use that symbolic link, and all works rather nicely.

In the end, I've put symbolic links to all my drive partitions in a folder called NETWORK. This way, programs can get at the files without freak'in out...MagiC does all the work ;) It's a hack, but it works ;)

At Bravo Sierra Computers you'll find Used and New Atari. Items you've been searching for. Item's new to you and Classic Atari long lost. Have you got Hardening of the Ataris? Check out Bravo Sierra Computers! Have you hugged your Atari today? Buy your Atari & yourself a present today! Buy from someone with 16 years of Atari experience. Buy from someone personable, polite & passionate about His Atari! And if I don't have what you want to buy or I don't know the answer to your question, I'll refer you to someone who does. That's the nice thing about the Atari community and my colleauges in the Atari business. We would rather send our business to a fellow competitor to get what they need than have someone abandon their Atari due to lack of support. For myself, I only use Atari! I get on the InterNet with my Atari ST, I use PageSTream for all my DeskTop Publishing, my DataBase is DataManager ST & besides playing games on my Atari ST I play games on my Atari Jaguar with my collection of Jaguar Games! I won't own neither a PC or a Mac. So buy from someone with a servant's Heart & someone who'll be around to offer you Atari support!

As already said this is a question of timeouts and thus can be
influenced with CAF_FIX.
What happens if you transfer a large block of data in a single transfer
to a slow device and the transfer takes more than 30 seconds? If you
have a hard disk driver that issues a SCSI reset after 30 seconds you
will never get this transfer done...

Note that SCSI error message sent by SCSI devices are not the same level
as timeouts. Timeouts don't result in SCSI error codes as displayed by
HDDRUTIL.

I'm a bit confused here Louis, in a previous post, you said you had problems with the STinG dialer bombing on disconnect _until_ you used your AUTOEXEC.BAT solution [if you'd like, I'll find and quote your post], but now you claim you "N-E-V-E-R" had any STinG disconnect-bomb problems? Which is it?

Well, can you please explain to me why ICD Pro 6.5.5 can recover from a "hard drive freeze up" in 10-30 seconds [and the Falcon functions normally after this as if nothing had happened] and HD Driver takes 1 to 2 minutes to un-freeze, and in the process, all SCSI devices go offline, reporting "damaged data" when trying to access any partition after the freeze-up, with a re-boot being the only way to get everything working correctly again?

And this makes HD Driver better because??????

Hi

The .ST files are an image of an Atari disk. Including the disk make up
data, 10 spt 81 tracks etc., the file is more than 720k it has to be!!

If you are after a specific title, why not buy the original rather than
make do with a copy!!

Hi

If you've been reading some threads, you will notice I'm having a tiny problem with getting my MO drive detected using HD Driver. I'm after borrowing s different DMA-to-SCSI host adaptor other than ICD Link II. I need to work out if it's the host adaptor or HD Driver itself!

Ideally I would appreciate someone in UK to aid my plight and I will cover postage costs etc...

Hmm, I'm afraid System Solutions' manuals are rather on the 'poor'
side ;(18 pages (ring !!) for MagiC PC and 32 pages for NVDI PC !
I still haven't found the 'easy step' taking a quick peek at them,
but since there _is_ this step, it's not that hard to find it.
(hint: like killing accessories ;-)

Still, Kevin had 22 entries and wanted only 4 of them, so deleting
the INF file, wasn't that bad, even compared to the 'easy step' ;-)

Yes, for the moment it has a (hmm, let's call it) GEMDOS protocol,
but works now quite happily under single_TOS (even on a floppy
disk with STinG / BNET and a 1 meg ST).

My priority for the moment is an Ethernet driver for 'pocket'
adapters, if it succeeds, then we'll have the 'horsepower';-) to
go to more complex protocols.

I don't know what's happening with the LAN ports, but I never managed to get
anything useful above 38400 bps. Even at this speed the connection is not
exactly reliable.

>On Falcon #1, the system will lock during boot as soon as screen blaster tries
>to show its resolution menu respectiveley change screen resolution. BNET.APP

>drive P:.
>
I think BNET.XFS is a legal MagiC XFS, not even depented on STinG. It uses
no timers, interrupts etc. At boot time it just installs itself and
terminates (resident of course ;-) But I might have missed something, since
my translation of magxdocs is far from perfect.
Have you tried without screen blaster ?

>On Falcon #2, both XFS and BNET.APP are running. That one is equipped with
>Screen Wonder PRO resolution enhacement hard/software. Anyway, although the

>in any way manipulated :-(
>
Normally you should be able to access the remote drives' contents, but if your
connection is not working properly (see above), then I'm afraid you can't.
Please try your link first, not with ping, but using any client/server eg
WebLight and CAB or FTP Server and aFTP or whatever, and post your results.

>display in any color setting, with or without interlace. Is the problem a
>result of the limited frequncies of my monitor? I have Nemesis.

Possibly the monitor, you have a very limited range of horizontal
frequencies which won't help a lot. I was looking at some of my library
files & most 800x600 resolutions seem to be around 44KHz.

You could try increasing the left & right blank values to decrease the
horizontal frequency of the display. I'm not sure if this will produce a
reasonable display on your monitor but it may be worth a try - the
frequencies specified are not usually exact so you may be able to get
something just outside the range specified in your manual.

Be very careful! I would be grateful to hear from anyone who has actually been granted their free service because they've "recruited" 4 more people.

On the face of it, it looks like a pyramid scheme, i.e. you can't join unless you get 4 other people to join. But those 4 people must also get 4 other people...

And in the process, they've collected thousands/millions of e-mail addresses for spamming purposes.

>the bootsector.
>

You can still use an extended format. I use DC format 3 to place a MS-
DOS boot info on the disks, so you can use disks with more than 9
sectors per track and 80 tracks!

I have a problemw ith Thing 1.27 and I can't find a consistent solution. The problem is some programs abort immediately at run time with the message: "Program ended with Basic error #-1". This can also happen while a program has been running for a while. The same programs work great with MagXDesk, Magic/ease and Geneva/Neodesk. The problems only occur running Thing. Does this sound familar to anyone? Sometimes changing program flags or unpacking a program helps, but the results are inconsistent.

> conversion of images in eg. CAB?
Sadly, none of these will benefit from the presence of an FPU (unless
there's an archive utility I'm not aware of which utilitises the FPU.
Only programs which are specifically written to take advantage of an FPU, if
present, will benefit. Programs such as POV and DynaCADD and a few other
CAD, graphics packages are the most likely candidates.

> Anyway, I guess that the expansion slot you are talking about and the Mega
Bus
> is the same thing?
Yes.

> Are there other utilities that can be fitted in it? What
> about graphic cards? Whats the cost?
The other common use for the slot is for graphic cards (I'm not aware of any
other applications but there's bound to be a few). I've used quite a few
different graphics cards over the years including the Matrix MatScreen, MGE
II and Titan's Reflex cards. None of these are still in production but if
you can get hold of a Reflex card they offered the best VFM in my opinion.

> Oh, almost forgot, how much would your FPU-board cost?
Forget it :-)

>and what about a MiNT system like my Milan? The xfs won't work here, I'm afraid
>:-(

Eventually it will work there as well, without any XFS. At present it already
works 'halfway'. This means that if you install it under MiNT+NAES the same
way as you do for singleTOS, then the other machines (not running MiNT) can
access the MiNT machine's drives via BNet. (I tested such a setup just now.)

The problem appears to be that the MiNT kernel prevents normal GEMDOS drivers
from being installed after MiNT, whereas BNET.APP/BNET.ACC is a GEM program
that has to be started after MiNT and GEM bootup.

That problem can be circumvented, but it will require some method similar to,
or even based on, my NetD API. This allows servers that need GEM multitask
timeshares to boot as TSRs (even under singleTOS).

>RA>Why just one ? If it was entirely due to BNet it should have bombed
>RA>both.
>
>I thought so, but that's not what I experienced. These Falcons are not entirely
>identical. Operating system and most Auto Folder programs are, but not memory,
>CPU speed and Screen Resolution Enhacement Hardware+Software.

I still don't see why it should bomb as described.
Is that problem fully repeatable ?

>RA>As discussed in other mail, I don't think that the LAN ports are safe
>RA>to use with current HSModem modules.
>
>I'll test it some more times, but I'm sitting far too long in front of these
>crt displays :-(

Who isn't ? ;-)

But seriously, don't waste too much time on the LAN ports at this stage,
because I really do think they need new driver modules to work properly.
I'll buy a LAN cable next week to experiment with this.

The max speed that anyone seems to have managed to use to actually transfer
any packets over those ports is only a little higher than Midi speed, and

Midi has a very reliable driver. Thus I suggest you use Midi instead.

This assumes that the Milan too has Midi, as all TOS machines should have.
If it doesnt, you can still use Midi between the Falcons, and Modem 2 from
one of the Falcons to Milan.

>As Harun described in scc_x.txt, the HSMODA drivers will provide some kind of
>hardware handshake, using DTR as RTS output and the incoming status line as
>CTS.

So he says, but apparently that does not work right. I don't know why,
but I know that everyone who reports testing it has not gotten handshakes
to work.

>RA>Again, this is typical for missing handshaking. Mouse movement steals
>RA>CPU time from SCC interrupts, and without handshaking this leads to
>RA>buffer full errors.
>
>I've heard about some design error in the Falcon's layout, giving the mouse
>interrupt a higher priority than the interrupt from the LAN port. Don't know
>exactly, but that might be an explanation.

I'd call it an unwanted feature rather than an error. It is true that the
mouse has a fairly high interrupt priority, as it is handled by the same
MFP interrupt that handles keyboard events. This is because the keyboard
also contains the mouse interface. Thus mouse events _are_ keyboard events
in the sense that they must reach the main system in the same way.

For compatibility reasons this interrupt must function identically to how
it has on earlier machines. The MFP interrupt is at level 6, and the only
higher level is 7, which is reserved for RESET and NMI operations. That is
why SCC is at level 5, below the level of MFP interrupts.

NB: This is not specific to the Falcon, but is identical on MSTe/TT.
Also, this is not specific to LAN but identical for Modem 2 and
Serial 2, which latter uses exactly the same half of the SCC as
the LAN port does.

All in all, I see no hardware design reasons why LAN should not work
equally well as the other SCC ports.

>Downloding files via GSZRZ ZModem from a BBS (Modem attached to Modem 2 port)
>will also produce crc errors when moving the mouse around, so I suspect that
>the Falcon's interrupt handling is far from perfect :-(

That is true, nothing is perfect, but the 'mouse' effect on serial data is
also dependent on CPU speed, so it is lesser on a faster system. But the
main point under discussion here was that there is a marked difference in
error frequency between Modem 2 and LAN ports, even when used at similar
speeds.

>RA>or the buffers are extremely small (like the default size).
>
>I've set those to at least 4k or the like, should be sufficient for many
>packets. And yesterday I inreased those buffers to 16k, but with no effect.

Then the problem is not just one of lacking handshake, but something more,
and probably much more serious.

>RA>Was WebLight also running on the Milan ?
>
>of course, yes, as the Milan is the machine that is always in use and has

>running (but not working) at that time. The final crash of Falcon #2 looked
>that way. I'll have to do even more testing to figure that out :-(

I'll accept that conclusion when you report error free WebLight operation
over LAN ports with BNet disabled. I'm fairly certain that such an attempt
will also end in bombs, however.

>doing them.

Well, that doesn't really help in Alpha Centauri system, where you can pop
out of hyperspace some hundreds of AU from your goal. The speed limitation
(appx 2/3 of lightspeed) has a big effect here, and even the brake feature
doesn't help much then. At best (speed limit not reached) instant braking
can only shave off 30% from the time needed for any trip inside a system,
as compared to symmetrical braking by reversing full boost at mid-point.

Once, when I used all 'features' available (including 60G boost), it still
took me over three weeks to reach an inhabited planet.

I think this is an intentional trap so that the unwary will fail a mission,
because it is so close to our sun that it looks like an easy job for those
who have not been there before.

>However, I much prefer the passenger missions, especially those that
>offer 10000 credits, since I can take upto 30 days before they start
>complaining about taking too long.
>
There are some risks with a passenger that offers lots of money.
He could be an enemy spy hunted by the navy (Imp or Fed), and if
that is the navy you work for they won't like it if you help him.
Also, some guys will promise anything in advance, but when they
get to the destination they will stiff you and run off.

I prefer nuke bomb runs myself, and they pay up to 25000.
But it takes high military rank and elite rating to get these,
and courier work is inevitable when building up a new commander.

I have several, with different specialties. The one that consumes
the most real-time to play is a guy who doesn't use any autopilot,
so every landing, docking, and fight he's had have been manual.

I also have a list for standard runs, but with the calculator it is a very
fast operation to find an optimized wormhole system between any two points,
since it can also handle multiple wormhole distances.

I've had no problem with that (guess my disk isn't old enough :-) ,
but I suppose that is why we can configure the CT2B NVRAM to add IDE
waitstates, and also why Cecile has selectable IDE access speeds.

Used correctly, these settings should solve most problems,
and then IDE access is still faster than on normal Falcons.

----- snip ----- re: unique CT2B design => CPU speed == bus speed == 50 MHz

Ah yes, that was it.

>>My CT2B unit needs more cooling than provided by the on-board fan,
>

>Original CT2 CPU-cooler is noisy.

Yep, but the one I had to add to also cool the ispLSI chips is even
noisier, and both are definitely needed I'm afraid. Hopefully this
will be less of a problem when I eventually 'towerize' my Falcon.
But I'll endure even the present noise level to get this speed.

>CT2 is a very good card :-)) I havn't changed my softs and configs.
>Thanks to Centek.

I agree with the first, though I have to add that I did find some
modifications of boot setups necessary. That was no more than I
had expected from the start though.

>
----- snip ----- re: 'corrupted index' messages in OKami news importing
>
>You never told me, Ronald. It's a weird problem you're having.

As you know I haven't been using OKami very long, and I didn't want to
report as errors something that could be due to my own newbie mistakes.
Now I do feel confident that something else has caused the errors, and
as it does match (partly at least) the problems others had, I felt the
time was ripe to mention it.

>It is impossible for oimport to create wrong index files, unless, of
>course, it crashed while importing. So those index files must already have
>existed, maybe with zero content, which was possible with older
>versions, but is impossible now. Look in the log file and you see
>exactly what is wrong with the index file. Run "ofind --Repi group" to
>repair the index. Run "ofind --Dbfchk group" first to see if the DBf
>is OK.

Ok, I will. But before doing either I took a quick look into the folder
for one of the affected groups (one named simply "alt.atari"). In the
news\alt\ folder I find three files related to this group:

atari.tix == 0 bytes
atari.dbf == 0 bytes
atari.idx == 56 bytes

Some quick peeks in other folders show that lots of groups follow exactly
the same pattern (tix == 0, dbf ==, idx == 56).

I will now do the tests you said, but for safety I will first save this
post, and continue its editing after the tests.

----- some tests later -----

ofind --Dbfchk alt.atari gave no feedback text at all
ofind --Repi alt.atari gave no feedback text at all

Inspecting the files 'manually' again I find that they seem identical.

Now I just have to wait until the next crosspost to alt.atari to see
if those commands make any difference. Since I can see no change at
all in the files, I'm afraid I have to doubt that.

>>This could mean that there is some routine in OKami 2 that Jos forgot to

>>then it should be very easy to fix.
>
>Impossible. The structures for the header of the index file and the
>index entries are defined in one header file (of course!) which is
>used by all modules.
>
That sounds to me as it should be, so then we must find some other cause
for the error.

Now, as I see it the problem always occurs when importing news, and that
makes me suspect oimport.ttp rather than OKami itself. The oimport.ttp
is a rather large program, so I suppose it consists of several linked
modules, and I note that Pure_C was used to develop it.

Hmmm. Some Pure_C shells do not allow fully flexible dependencies to be
defined, so that updating a '.H' file does not necessarily enforce the
recompilation of all modules that use it at the next 'make'. Instead
the programmer must remember to compile each affected module, or to use
some 'make all' command rather than just 'make'.

I have used such shells myself, and sometimes I have forgotten to do this
for one affected module, leading to situations where one module uses old
structures while all the others use new ones. If that module is only called
for some rare special cases, the problem would remain hidden until such a
special case occurs.

Is it possible that something like this could have happened to 'oimport' ?

Dupe crossposts to previously non-existent groups does sound like a pretty
'special' case to me, as it would only happen occasionally, and not at all
to someone who had used those groups previously, before converting to the
new format.

Do you use ALIAS file with your POPWATCH.PRG?
Create this ALIAS file with only one line:

* tesla1

All incoming mail will be saved by POPWATCH as a mail for tesla1.
This should solve this (particular) problem.

>is this another internet provider in its own right?

Yes, I think this is the technique although I can't check the thing
out until I have enough 'References' to get my freecall number and
password. Certainly, their homepage does not mention how many mail
addresses you can have or how much web-space they offer so I guess
they are not actually an ISP but just a connection-rerouter.

The Atari monitor outputs are a bit hot....if you use the RGB either you
need a fairly forgiving monitor (Phillips 8833's are) or some resistance
(not a lot though)....people who have doen that tend to put resistors in
their mono VGA adpators, but it isn't important, you'll just have to turn
down the brightness a bit as it will drive them all just as hard....I've
built loads without resistors and no complaints yet....

I didn't use a game editor for this one, I modified the program code for
this one. The info was taken from a cheat for the PC version, which
modified a Panther to give a huge cargo space and upgraded the forward
thrusters somewhat. I just did a bit of searching and made the list up
for all of the available ships.

That's why I only use the autopilot to set the direction to wherever I
want to get to and for the docking. I manually set the speed to get
there as fast as I can.

>I think this is an intentional trap so that the unwary will fail a mission,
>because it is so close to our sun that it looks like an easy job for those
>who have not been there before.

Probably, I fell for it as well. Mind you, I found a quick way of doing
these sort of missions.

First, collect several to one system and a few others to other systems.

Make sure you've got a lot of fuel and then jump to the system with the
most deliveries.

Once in the system, set the next destination system as one with some of
the other deliveries after setting the autopilot to get to a space
station.

Once you arrive at the station, dock and leave straight away. Keep an
eye on the deliveries and, as soon as the last one is paid for, do the
hyperspace jump.

If you time it right, the deliveries for the system you just arrived in
will continue to be removed.

One thing to note is that I've not yet managed to do this using
wormholes, so a big drive and small ship are a great advantage here.

>>However, I much prefer the passenger missions, especially those that

Ah, ask for half of the fee first. If they refuse, don't take them. If
they do pay some, they'll pay the rest.

>I prefer nuke bomb runs myself, and they pay up to 25000.
>But it takes high military rank and elite rating to get these,

I know, I'm slowly building my commander up. It doesn't half take it's
time when you get to the higher ratings/rankings.

>I have several, with different specialties. The one that consumes
>the most real-time to play is a guy who doesn't use any autopilot,
>so every landing, docking, and fight he's had have been manual.

I tried something like that and, after repeated crashes, gave up on it.
Mind you, I wasn't that experienced with it so it's not too much of a
surprise. I might have another go with one like that, just to see if my
piloting skills have improved. Doubt it though...

>----- snip ----- re: 60 G: speed_ratio == square_root(boost_ratio)

They're the worst ones I've met. All the others seem to be much less
accurate with their weapons and easier to fight off.

Now I've not had to do multiple wormhole jumps yet, but then again I've
not travelled more than ~75 light years from Sol. The only exception of
searching out the colony ~256 sectors from Sol.

Ah. Now that's handy to know: I knew about the patch program but hadn't
realised it allowed you to use HD discs in TOS earlier than 2.06. Presumably
you can't format them without a separate formatter, though. Upgrading to an
HD drive has been on my list of potential upgrades for my STE for a while...

Hallo !

S>I can't get my copy of this to work. Is it compatible with 14mb Falcons?

Of course it is. You haven't even got to to do a "clean boot" as recommended with a 4meg machine.
I've got the original (bought it in Neuss last year), and that one works well on both of my Falcons. #1 is equipped with 14MB, Screenblaster, MagiC & some more stuff, and I can simply start it from my normal desktop. #2 is equipped with 4+8MB, Screen Wonder PRO and the usual stuff as on #1, and Running will also run from my normal desktop. No problems at all, until it comes to leaving the game again. Then, MagiC will report a damaged memory block. Recovery is possible, but the mouse pointer will remain hidden and the system will be unstable. But that's only _after_ some hours of gameplay :-)

Hallo Vassilis!

VP>I don't know what's happening with the LAN ports, but I never managed
VP>to get anything useful above 38400 bps. Even at this speed the
VP>connection is not exactly reliable.

That's what I had to learn, too. :-((

VP>Have you tried without screen blaster ?

I did it right now, and that way it will no longer block the system. But it
won't work properly either, as I now have on both Falcons the BNET folders
representing the other system's drives, but neither of these can be opened.
"u:\bnetwork\FALCON2>cd Cx\" in the mupfel reports "Folder Cx\ not found",
although ls will show all of these folders.

VP>Normally you should be able to access the remote drives' contents, but
VP>if your connection is not working properly (see above), then I'm
VP>afraid you can't.

There are some (few) lost packets, but in general the STinG network is
operational.

VP>Please try your link first, not with ping, but using any client/server
VP>eg WebLight and CAB or FTP Server and aFTP or whatever, and post your
VP>results.

I did that this afternoon, having weblight installed on Falcon #1, the dns on
the Milan and CAB 2.7e on Falcon #2. CAB will read HTML files & graphics from
the other machine without problems. The transfer rate is around 2000 to 3500cps
on the 38k4 LAN connection, depending on the amount of dropped packets.
The Dialer's statistics window indicates 28163 bytes sent, 247665 bytes
received, 4 packets dropped. Total datagrams 1059, TCP: 41 dropped.
The MTU is set to 4096, for the LAN ports, but 1500 for Modem 2 on Falcon #1.
Thus, the MTU size used is 1500.

Hallo Gary!

GS>I would like to install slip/ppp software on my Atari ST so I
GS>can (through a null modem cable) hook it up to a unix server and
GS>connect it to the net.

STinG should do that. If you can't get that on a disk, you could try and use a terminal program on both the ST and the PC in order to transfer the files via ZModem, using the null modem cable.

>a "Faulty IDX file". It tries to correct it, then displays all the
>messages, each time I go back I get the same message.

Are you sure you use the last version of Okami?
I encountered the same problem with the version dated March 17-th, but
it was fixed soon.
Check the lenght of the files:

O.PRG 283838
O.RSC 25050
OEXPIRE.TTP 77782
OEXPORT.TTP 92680
OFIND.TTP 109282
OIMPORT.TTP 94518
CONVERT.TOS 34012

Then move faulty IDX file into a save place and start OFIND.TTP with a
parameter:
--Repi name.of.the.faulty.group

The index file will be rebuilded from a DBF file.
If this didn't solve a problem, send your log files to Jos - I am sure
he will help you.

If you format a 720k disk as a 720k disk on your pc, you'll be able to
read and write to that disk with your Atari. That is what I do for small
files under Windoze '98;)

>the default value in the package was. I use a MTU of 1500. It works
>fine, but I just wonder if some other setting might not be more 'optimal'.

It would indeed. The only reason reception buffers of 256 bytes can work
at all is that Midi does not use extreme speeds, and that TCP protocol
itself ensures retransmission of dropped packets. Even so you probably
don't get very good efficiency for intense traffic, and especially not if
other tasks load the CPU.

I myself use a reception buffer of 16384 for reception and 4096 for the
transmit buffer. For any line without handshaking, the reception buffer
should be at least as big as RCV_WND, since that is the flow control
limit of TCP. But as many TCP connections can be active at the same time,
it is best to make the reception buffer somewhat larger.

>Oh, and one last couriosity...
>Is it possible to set up a gateway from the internet to machines on my
>LAN that aren't connected via the modem.

Olivier Booklage has written a so-called gate server which can pass any
TCP or UDP traffic that reaches the modem machine to some other machine.
Which machine that will be can be set for each TCP and UDP port number.
This server is based on my NetD API, so you will need that as well.

>I.E. I use the Falcon to dial
>in, and can have users connect to the falcon via the dynamic IP that is
>issued (and masked of course to whatever I'd set) at dial up. My ISP
>also gives a valid dns for that assigned IP, alla user091.localink4.com
>which can be used to attach to my falcon...but what if I wanna pipe it
>off to the Mega on down the LAN? I.E. run ftp_server on both machines,

Uh-uh, no go I'm afraid. Suppose we get an FTP request addressed to the
dynamic IP and the standard TCP port for FTP. There is no more address
information available, to also allow selection of which local machine to
use. Therefore all such requests must either reach the modem machine,
or be passed to another machine by the gate server. There is no way to
distribute some of the requests to one machine and other requests to
another. The same naturally applies for other protocols, although the
gate server does allow different local machines to be used for different

protocols, but only one machine for each protocol.

There is a way around this limitation, but then the client used to access
the servers must be able to use non-standard ports. (Most should be.)
More on this follows further below.

>and get at either one from my job at school? Well...yeah, I know I could
>just pop symbolic links in the valid ftp path and pull them across with
>BNET,

In fact you can do it other ways too. For instance, you can define the FTP
path on the machine running FTP Server to be U:\ (with password of course),
and then access BNet through the link on U:\. I myself do almost that,
except that I use V:\, which is a BetaDOS cluster drive (similar to U:).
That is because I can then do things exactly the same way under singleTOS.
In either case you don't have to create any new links yourself, since these
links are created automatically at boot of the filesystems for U: or V:.

>but I'm thinking further down the line...like when someone comes
>up with a way to telnet into a shell and actually run some things on the
>Falcon remotely.

That would require something like the gate server, but it would still only
allow one machine to be reached for a given standard protocol port.

But of course, you _can_ use nonstandard ports too, as long as the client
software to be used also allows this. Then you can have one FTP server
on each machine, and tell the gate server to listen to different TCP ports
for each of those machines, and to pass the traffic along to the standard
FTP port of each machine. So the FTP servers do not have to be reconfigured,
and listen only to the standard port. Only the gate server and the client
are aware that the nonstandard ports are being used.

>Oh...one last last thing to point out (promise, this 'really' is the
>last).
>
----- snip ----- re: problems with MagiC file selector and BNet.

Well, as I said in a private mail on this subject, I think that this is
really more indicative of how bad the MagiC file selector is. On all my
systems it has always had various odd problems. Even if BNet or STinG
and any extra filesystems are not present. There are still lots of
stuff that it simply doesnt work with.

Any alternative file selector would be better. I myself use Freedom2,
and with this I never see the problem you described. I have passed
the info to Vassili, so he can look for something that could cause it.
But even if he does and fixes it, I still recommend another selector,
because the one in MagiC has never worked properly for me.

----- snip ----- re: creation of symlinks on remote drives

Implementation of symbolic links on added filesystems is optional,
not mandatory, so this is not a bug. The BNet protocol may be

extended later to allow this sort of command to be sent to the
remote drives, but at present links will have to be created locally.

Access to linked items through BNet naturally does work already,
since this allows the link to be resolved on the machine where it
resides. It is only direct access to the link itself that is not
implemented.

>Hi Ronald,
>
>I seem to have missed that part. Can you explain why LAN isn't good?

Hi 'Q',

There's probably nothing wrong with the hardware of the LAN port.

But all who have reported trying to use it describe strange symptoms
leading to total system overload, even when the port is not set to some
very high speed. And all reports also agree that handshaking on this
port does not work, so that data transfers suffer lots of errors.

All of this indicates that the LAN sections of SCC.PRG are bugged and
in bad need of debugging or rewrite.

>you.

Well, I'm not sure I want the programs yet, since I already have some, and
I prefer to disuss the matter here (in case others are interested too).
Is your game editor something new, or the same 'Pompey Pirates' editor
that I have ?

If it is the same, then you may be interested in a modification that I made
(after disassembly), which allows installation of 60 G thrustors.

I still wouldn't advice accepting any courier missions to Alpha Centauri,
because there your hyperspace exit is just too damn far from the inhabited
planets. But for most other purposes 60 G thrustors make a big difference,
though its effect is still limited by the natural laws for such things.

To be precise, with symmetric front and aft thrustors, and not using any
braking cheats, t = square_root(x/a) where x is total distance, t is total
time, and a is acceleration. So 60G is twice as fast as 15 G...

As for wormhole calculation, I think this is best done on a programmable
calculator, so it can be done while playing the game. I myself use an
HP48G calculator for this.

Hi Ken,

On Fri, 07 May 1999, Ken Macdonald wrote:
>Ronald Andersson wrote:

----- snip ----- re: Doom clone speed on CT2B-Falcon

>ronald
>this is one time too many you mention the CT2! :-)

I understand your reaction. The CT2B speed is impressive, especially
after the disappointment most Falcon owners have had, in discovering
how much Videl slows down the CPU at high or colour-rich resolutions.

>please tell me how it is to install (did you do it?)

Yes, I did do it myself, but I can't recommend it for everyone.

The installation requires cutting some PCB traces, as well as
cutting some pins and desoldering others. Some of these changes
make it impossible to 'go back' to original state without getting
replacement circuits. Also, some mistakes may make it impossible
to complete the installation. This could make the Falcon useless.

CT2B installation should only be done by someone who is really
confident in his/her ability to complete the job properly.

>do you have the max ram?

No, I only have 32 MB of FastRAM, whereas the current maximum is
128 MB IIRC (could be 256 MB, I'm not certain). The CT2B needs
an EDO SIMM, which can be ordered from Centek (or elsewhere).

>what hardware is it compatible with (i.e. nemesis, NOVA,...)

AFAIK Nemesis is an accelerator, so that is out. You have to choose
one or the other, and CT2B is definitely faster. CT2B raises speed
of all relevant circuits to 50 MHz, including CPU, FPU, DSP, Videl.

Whereas most other Falcon accelerators are limited to 40 & 20 MHz for
CPU and bus respectively, CT2B is alone in having accomplished 50 MHz
for _both_. No other accelerator is meaningful to use with CT2B, as
they are all slower and less efficient. Also, since a 68030 CPU is
used there is no problem with CPU incompatibilities such as has been
the case for accelerators based on newer processors.

As for NOVA, I have no idea. What do you need it for ?

I should add that there are some problems I've seen with CT2B:

It is dependent on a specific usage for PMMU mapping, making most
PMMU-manipulating programs incompatible, such as MAGTOROM, VRAM,
OUTSIDE etc. Most such stuff is for virtual RAM, however, and
with a large FastRAM SIMM installed they are no longer needed.

The boot mode used to enable FastRAM access installs a PMMU map that
is not fully compliant with Atari specs, in that the address range
$FFxxxxxx is not fully equivalent to $00xxxxxx. This gave me some
problems, but I have a way of activating FastRAM in one of the other
bootmodes, so I use this instead.

The interrupt acknowledge signal of the DSP does not 'reach' the CPU
on the CT2B board. A software patch exists to simulate acknowledge
behaviour at (seemingly) 'spurious interrupt', but later I plan to
install a hardware patch so that the real signal 'gets through'.
The shematics of that patch are available on the net, with docs.
(Sorry, I don't remember the URL right now.)

My CT2B unit needs more cooling than provided by the on-board fan,
even though I also still have the original Falcon fan installed.
I now use a third fan, which is a bit awkward, but this problem
will be less trouble if a 'tower' is used to house the falcon.
(I use it in its original STe-like cover.)

So that was the 'downside' of having a CT2B.

The speed is what compensates for those problems of course and
the fact remains that no other accelerator can achieve the same
Falcon speed at present.

Yoy can find lots more information on Centek's own homepage,
at the URL "http://GARFIELD.SITECONSEIL.COM/centek/english/index.htm"

Ok. Then I assume you simply meant the +5V supply for the 74HC280 chip,
correct ?

> I was thinking of picking up the 5v supply from the 30 pin

If you mean to do this simply to drive the 74HC280, then that is perfectly
all right, of course.

> connector that plugs into the mother board, once I've determined
> the pin no's. If anyone knows the ID for these it would be helpful.

Vcc (+5V) is available on three pins, for minimum contact resistance, these
being pins 26, 28, 30. Ground is likewise available on three adjacent pins,
these being pins 25, 27, 29.

2467. Atari ST to VGA monitor cable

Newsgroup: comp.sys.atari.st
Date: 1999-05-08 00:00:00 UTC
From: Ian Numan <iannuman@netspace.net.au>
Message-ID: <3733B136.F3312C33@netspace.net.au>
Source record: 79161

I have already made an Atari ST to VGA cable with the details I found at:
http://tyndale.apana.org.au/~colbee/ATARIVGA.HTM

This cable works fine (high res mono), but then I found some more details at:
http://www.multimania.com/bales/text/st2vga.txt

Both cables use exactly the same wiring details, except the one at multimedia.com
uses a 4K7 resistor on the Atari pin 11 (mono out).

The cable I made does not have this resistor.
What is this for?
Will I damage my Atari ST or VGA monitor if I keep on using my cable which doesn't
have a 4K7 resistor on pin 11?

Thanks
Ian

>
>AM I wrong, Nick????

I remember that post too, so you are not wrong. I've been thinking about it,
and comparing it with some of my own experiences.

I too have gotten some complaints about 'corrupted index' when importing.
For me this has never struck any newsgroup that was part of my original
setup, and which was thus affected by CONVERT.TOS. It has only struck
such groups as have been created 'automagically' for crossposts after the
conversion was made, and as far as I can tell it has struck _all_ of them
every time.

This could mean that there is some routine in OKami 2 that Jos forgot to
update, so that it still creates IDX files using the old format. If so,
then it should be very easy to fix.

Hmmm, come to think of it, that code should not be in OKami itself at all,
but should be inside the OIMPORT.TTP, since it is that which handles newly
received mail and sorts it into the various groups.

>already has speeded up the bus to 25MHz,

No, CT2B speeds even the bus to a full 50 MHz. That is the big difference
between it and all other accelerators (AFAIK). They need to have the bus
at half the speed of the CPU, but the CT2B breaks that barrier.

>and the Nova because the current
>run of CT2's don't have a through-port for the Falcon expansion-slot.

That is correct.

>The lack of this port is very bad news, because this means that you can't
>install any graphics-cards later on :-(IMHO a very bad move by Centek.

Perhaps. I certainly agree that I would prefer having a through-port.
But I see little reason to use it for a graphics-card, since Videl is
a very flexible graphics chip in itself, and does not affect the CPU
load at all when software runs in FastRAM. The only accesses that are
affected by Videl are those that access original RAM (ST-RAM).

>Apart from this (and the pathetic low RAM-limit) the CT2 appears to be a
>very solid and nice accelerator.

I don't regard 128 MB as a pathetic FastRAM limit. There are lots of people
in the Atari scene who use harddisks that are much smaller than that. I
myself find 32 MB FastRAM quite satisfactory, and since I still have my
14 MB of ST-RAM I'm now using a total of 46 MB RAM. Why is that pathetic ?

Hi James,

>What's the best CD Rom driver thats compatible with MagiC 6 on a Falcon?

I won't argue about what's best and what isn't, that is up to each user,
but you may find it interesting to try my BetaDOS (URL in my SIG below).
That is naturally what I use myself.

It does not use any XFS drivers, but is nevertheless compatible with almost
everything that runs under MagiC. The exceptions are that the built-in
file selector of MagiC does not like non-XFS file systems, and for similar
reasons BetaDOS drives can not be accessed from U:.

The latter does not matter much because a BetaDOS driver also exists that
defines a so-called 'cluster drive' that is very similar to U: and allows
access to both XFS and non-XFS drives. The nicest thing about it is that
the cluster drive can be used identically under singleTOS and MiNT too.
(That is why I created it in the first place.)

BetaDOS is also compatible with MetaDOS drivers and with ExtenDOS drivers,
although I have not yet tested it with any drivers from the ExtenDOS GOLD
release.

In original state they are always 8 MHz, but accelerators exist that can
make them a lot faster. I have one T-36 that accelerates to 36 MHz
and even faster ones exist, including some that upgrade the CPU type.
But the standard speed is 8 MHz.

Hi All,

I have a problem with login in a new user in Okami.The problem is that I import mail from several mailing lists and when I reply to a message in the mailing list say zetnet-atarians mailing list I click on write followup and the message message dialog box comes up.

The top part of the dialog box where it says FROM: has something like FROM:zetnet-a(Gordy) on it.What I used to do before was click on login from the menu then have type in my login name and the problem would be solved but the login does not work anymore.

I have tried disabling PASSWD file changed O.INF for single user but them Okami will only import messages for tesla1 and none from any of the mailing lists.Is there a way for all E-mail messages whether from mailing lists or to me personally be imported into Okami into my own mail group?

Any help will be truly greatful.

Gordy.

>If it is the same, then you may be interested in a modification that I made
>(after disassembly), which allows installation of 60 G thrustors.

Sounds similar to my ship :) ATM I've an Eagle Mk 1 with 8 missile
pylons with 60 G thrusters (front and back) that I traded in a Panther
for. While this is great for everyday usage, it's a pain when I meet 3,
or more, similarly equipped pirates.

>I still wouldn't advice accepting any courier missions to Alpha Centauri,
>because there your hyperspace exit is just too damn far from the inhabited

>though its effect is still limited by the natural laws for such things.

Ah, but that's where the braking 'feature' comes in very useful. The
combination of quick arrival, by wormhole if required, 20+ days to
complete the mission, manually setting the speed to the max. (~200000
km/s) and using the auto-pilot to do the fast slowdown is a good way of
doing them.

However, I much prefer the passenger missions, especially those that
offer 10000 credits, since I can take upto 30 days before they start
complaining about taking too long.

>To be precise, with symmetric front and aft thrustors, and not using any
>braking cheats, t = square_root(x/a) where x is total distance, t is total
>time, and a is acceleration. So 60G is twice as fast as 15 G...

That's something I didn't know. That explains why it doesn't make a
great deal to the time it normally takes to dock. Still, it comes in
useful when outrunning the damned Imperial Couriers :)

>As for wormhole calculation, I think this is best done on a programmable
>calculator, so it can be done while playing the game. I myself use an
>HP48G calculator for this.

I used to do it with a spare ST until I decided that would be quicker,
and easier, to make a list of the wormholes for the systems I regularly
visited. The last time it was updated I had only 27 wormholes listed, so
it's probably about time I added a few more.

2477. Re: SMPTETrak Hybrid Arts problem on MegaST

Newsgroup: comp.sys.atari.st
Date: 1999-05-08 00:00:00 UTC
From: claytone@aa.net
Message-ID: <7h0ov3$5q8$1@slave2.aa.net>
Source record: 79171

Hi James,

I used to use SMPTETrak on a 1/2meg 520ST before I had a HD. Then I upgraded to 2-1/2megs and later got a HD. I used AHDI, and then ICD 6.5.5, and it all worked great. That "out of memory" error sounds vaguely familiar, but I can't remember what was going on at the time, or if it even had anything to do with SMPTETrak. Have you tried deactivating AUTO-folder and ACC programs? When you unhooked the HD, was the ICD driver still running at boot-up? If so, it would seem that that isn't the problem, and that it could be the HD, somehow. Did you try booting up in mono, or is that already being done? If you're running the program without the HD (and it runs OK), then you must be booting the program off of a floppy. Is this a "master" floppy - with the code that allows the program to boot without the SMPTEbox/key being hooked up? (Or do you even have such a floppy? I can't remember if I did.) When you run the program off of the HD, the system checks for the SMPTEbox. If it's not there, damaged, or not hooked up right, you may get various messages. Can you boot the program off of that floppy if the HD is hooked up? Have you tried using a different HD driver? There are several demos/freeware/shareware on the ftp sites. Soundpool has a free updated version of Atari's AHDI. I used an older version of AHDI before I got ICD, and it worked fine too. Yes, you should be able to run SMPTETrak on a Mega2ST, and I suspect the problem has a very simple solution. Sorry I can't pin it down for you. Hopefully another Hybrid Arts fan can be more helpful. Good luck, and let me know if I can (try to) be of any other assistance with SMPTETrak.

I have a Falcon now, and had to get the latest commercial release of MIDITrak (since I had sold my SMPTEbox), because all the earlier versions won't run on the Falcon. Even tho I also have Logic, Logic Audio, and Master Tracks Pro, I still do almost all of my sequencing on MIDITrack.

That's rights, on your Falcon acces to fast-ram is 6X more fast, and 2X more
fast on ST-ram. On ST-ram, CT2 use wait states so 32Mhz is maybe an average
speed...

>As for NOVA, I have no idea. What do you need it for ?

Only for an AB040 ;-) because acces to ST-ram are more fast on a normal
FALCON.

>I should add that there are some problems I've seen with CT2B:

>_every_ time.

You never told me, Ronald. It's a weird problem you're having. It is
impossible for oimport to create wrong index files, unless, of course,
it crashed while importing. So those index files must already have
existed, maybe with zero content, which was possible with older
versions, but is impossible now. Look in the log file and you see
exactly what is wrong with the index file. Run "ofind --Repi group" to
repair the index. Run "ofind --Dbfchk group" first to see if the DBf
is OK.

>This could mean that there is some routine in OKami 2 that Jos forgot to
>update, so that it still creates IDX files using the old format. If so,
>then it should be very easy to fix.

Impossible. The structures for the header of the index file and the
index entries are defined in one header file (of course!) which is
used by all modules.

ExtenDOS is pretty hard to beat, although Spin appears reasonable. I think MetaDOS might be able to be used by MagiC but someone might be able to confirm/otherwise this...

I personally use ExtenDOS Pro 2.4a. I have an archive of Spin but no drivers were in the archive and I tried for days to find them on the net with no luck...hopefully someone has written a Macintosh HFS one by now?

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

>mention in the manual. I've MagiC 6.01 english release. Any idea
>as to how I can discover what these things do?

Some of them are covered in the manual (eg WBDAEMON), some aren't.

>WBDAMEN.PRG

This can be used to give you a write-back cache for your hard drive.
Dangerous things, write-back caches, but if you want to use it put it in
your MagiC start folder.

>ADDMEM.PRG

This is used to add extra system memory for some functions (not sure which
as I've never had to use it). If you get constant out of memory messages
while you seem to have loads of free RAM, try adding a copy to your auto
folder. You can use more than one, just call them ADDMEM2, ADDMEM3 etc.

>HARDCOPY.PRG

No idea what this does.

>MAGXB032.PRG

MAGXBOOT for 030 machines. Gives added memory protection for the kernel (?).

>ROMDRVR.PRG

I *think* this is some kind of cartridge port driver, though what you use it
for is a mystery. No idea how you use it.

>CRASHDMP.TOS

This looks like some utility for dumping a copy of the memory to disk after
a crash. It *may* be what MagiC calls if you say you want a memory dump when
it asks you if you get a serious memory violation.

>LIMITMEM.TTP

This is a hangover from earlier MagiC versions: you used it to modify
program files to limit the amount of memory they could grab - useful for
memory hogs like 1stWord. It's redundant now and its use is discouraged as
Magxdesk can limit memory usage while installing the app, and this way
doesn't modify the program files at all.

>MEMEXAM.TTP

Never used this, but it's apparently for checking which program is using
which bit of memory.

Have you got your HD software on a floppy if so try booting from that,
as your Boot partion may have been corrupted, and that may be why you
can access it.

Quantum P52S hard drive (52 Mbyte SCSI) - $75.00
comes with Supra host adapter & power supply, Supra software and manual, DMA cable, 2 drive SCSI cable, power cable and is installed in shoebox case that will
hold two hard drives. Included software installed on drive: Quick ST II, iamond
Back II, Universal Item Selector, Hot Wire, Ultimate Virus Killer, MaxiFile III,
Diamond Edge + original disks + manuals.

SM124 monitor - manual and original box - $40.00

SF314 disk drive - manual, cables, original box - $25.00

Practical Solutions monitor master - $10.00

C-manship Complete - book and disk - $10.00
(also will include Compute's Learning C book with this)

ST X-former cable (connects 8-bit Atari drive to ST) - $10.00

Turner's Atari books (vol. 1,2, & 3) - $10.00

All items are in great working condition and cosmetically clean and in good shape.

See something you would like to have, but don't like my price. Make me an offer.

Terms: Continental US addresses only please. Buyer pays shipping.

Please reply via e-mail to: gwestndrf@aol.com

Actualy, Michael Ruge mentions a couple of things in CHIPS555.HYP
but since my German is rusty, I'm not sure what to make of it.

> All of this indicates that the LAN sections of SCC.PRG are bugged and
> in bad need of debugging or rewrite.

Make that, the whole HS-Modem is bugged. On my Stacy, I cannot
use MIDI.PRG with MiNT. It freezes the machine during bootup.

Seems to me it's about time someone wrote some opensource, freeware
replacement drivers for our platform.

This is not correct, the Falcon-bus runs "only" at 25MHz. The CT2 itself
(CPU, FPU, RAM) runs at 50MHz though. This is basically the same design as
the Afterburner and Mighty Sonic, except that the Afterburner don't work
at speeds over 40-42MHz.

> But I see little reason to use it for a graphics-card, since Videl is
> a very flexible graphics chip in itself, and does not affect the CPU
> load at all when software runs in FastRAM. The only accesses that are
> affected by Videl are those that access original RAM (ST-RAM).

My experience with my Afterburner and Nova is quite the opposite. Even
with a 25MHz bus the Videl is still lightyears behind my graphics-card. My
old ISA Mach64 is 20 times faster than the Videl in 256 colours, and the
new Rage from Titan would probably be even faster.

Also, all access to videoram goes through the Falcon-bus, so on the Videl
all graphics will be significantly slower in 16-bit than 256 colours,
which again is a lot slower than 16 colours. The slowest mode on my 1Mb
DRAM Nova (16 bit) is ten times faster than the fastest mode on the
Videl...

>>Apart from this (and the pathetic low RAM-limit) the CT2 appears to be a
>>very solid and nice accelerator.

> I don't regard 128 MB as a pathetic FastRAM limit. There are lots of people

128Mb?? According to Atari Computing it's only 32Mb, which isn't that much
if you're into graphics or have a lot of stuff running in the background.
128Mb is *not* pathetic, especially not since the AB can only handle 64Mb
;-) (I find that a bit to limiting, but I can live with it).

> myself find 32 MB FastRAM quite satisfactory, and since I still have my
> 14 MB of ST-RAM I'm now using a total of 46 MB RAM. Why is that pathetic ?

I have a total of 68Mb in my Falcon/Afterburner, and with everything
loaded and running I have 50Mb free. That's without any apps at all...

> Whereas most other Falcon accelerators are limited to 40 & 20 MHz for
> CPU and bus respectively, CT2B is alone in having accomplished 50 MHz
> for _both_. No other accelerator is meaningful to use with CT2B, as

I find it *highly* unlikely that the CT2 drives the Falcon-bus at 50Mhz, especially considering how difficult it is to run it at 25Mhz with other accelerators... Also, most of the chips on the Falcon (e.g. Combel) can not run at this speed. Not to mention the ST-RAM itself which barely runs at 25MHz...

I'm 99% sure that the Falcon itself runs at "only" 25MHz, while the CT2 runs at 50MHz. The benchmarks published by Atari Computing also indicates that, as ST-RAM access is "only" twice as fast as on my Afterburner (which again is about 20% slower than on a standard Falcon).

If you read the review in AC#12 it says:

"During development, the CPU to fast RAM and Falcon motherboard interface was 25MHz, now it's always running at a full 50MHz, with wait states for slower hardware like the Falcon motherboard, rather than switching the CPU down to 25MHz for every access."

> they are all slower and less efficient. Also, since a 68030 CPU is
> used there is no problem with CPU incompatibilities such as has been
> the case for accelerators based on newer processors.

I have a 040 myself and wouldn't trade that for a 030 at *any* speed... I don't have one single problem with incompatibilies, but then I don't play games on my Falcon... Anyway, the 040 is so much faster than a 030, and only marginally more expensive. E.g. it's FPU is about 15 times faster than a 882 clocked at the same rate, and despite of the slower clock my AB outruns the CT2 in all areas except ST-RAM.

> As for NOVA, I have no idea. What do you need it for ?

Hehe, you've obviously never see one in action... Believe me, the Videl can not compete with even the lowliest ISA graphics-card, regardless of bus- and pixelclock.

> It is dependent on a specific usage for PMMU mapping, making most
> PMMU-manipulating programs incompatible, such as MAGTOROM, VRAM,

> with a large FastRAM SIMM installed they are no longer needed.

There's also other uses, like memory protection, or paging to prevent fragmentation. MMU-support for CT2 is IIRC in progress in FreeMiNT.

Kits are available from various suppliers, the Upgrade Shop springs to mind.
You can't just swap the drive (though if you do it will work quite happily
as a DD drive, apparently): you need a controller upgrade too and TOS 2.06
or higher (or MagiC).

I suspect you'll find more info in the Quick FAQ
(http://quickfaq.atari.org).

>
>So tell me--What can Word Perfect do for me that the above programs can't?

Well, never having used the Atari version of WP I can't comment on it, but here are a few general thoughts:

Generally, using a good text editor is all you need for plain text such as email, so you're on the right track there. I don't know Edit Plus, but if it suits you stick with it. If you want to try some others, good ones are Everest and QED. Both of these are multitasking-friendly (should you decide to dip a toe in those waters) and support system extensions like OLGA. Everest also supports abbreviation files (shortcuts), which are useful for things like HTML (web page) authoring. QED may also, but I don't know. The combination of Everest, CAB and OLGA is *great* for web authoring.

For WYSIWYG word processing, including basic DTP functionality, you'd go a long way to beat Papyrus, though it has the odd quirk, such as no word count.

For full-blown DTP PageStream has a good reputation anyway. The only real competitors are Calamus and DA's Layout. Unless you are needing power-user features or are unhappy with PageStream for some reason I'd stick with it.

If you use the spreadsheet etc in AtariWorks, then you'd need to buy standalone replacements if you were to change your word processor. Texel is the obvious spreadsheet, Twist the obvious database. But you will lose the easy integration between modules.

A lot of more recent software (eg Papyrus and Texel) seems to be happier with NVDI rather than SpeedoGDOS, and I can wholeheartedly recommend it: it not only does the font handling but also accelerated your graphics routines dramatically. The downside is that some older programs don't like it and AtariWorks doesn't get on with it fully (I believe because it relies on some bugs in the Atari VDI/GDOS which are fixed in NVDI, ironically).

I guess, in summary, if what you have is doing what you want and you like the way it works, stick with it. If you need better word processing than Word Perfect or AtariWorks can currently provide, check out Papyrus. If you want an integrated package, AtariWorks is probably the best you'll find as there aren't many other choices. Replacement apps will be expensive and lack the integration. If you are sticking with AtariWorks, you're probably better off with SpeedoGDOS, otherwise NVDI might be worth the money for the acceleration. It also handles TrueType fonts (so does Speedo in later versions, but it sounds like your system may be of a certain vintage and have an early version).

IMHO, Windoze 95 actually read the boot sector of the disk in the drive,
for the first time ever. It was done to save the cost of disks in the
floppy disk distribution of it, so that they could be formatted 82 tracks,
10 sectors. AFAIK, there was no floppy distribution of Windoze 98, so that
bit of logical behavior came back out. So, again, you have to feed the
disk drive something the machine is programmed to expect, and it does
not expect the number of FATs the Atari format might use, or one byte of
the bootsector.

OTOH, Atari reads the boot sector, so usually can read Messy Dos disks.

AFAIK you can only use VM (and memory protection) on 030 an above, as 68000
hasn't got the required memory management bits.

I have similar problem with a similar setup:
I have a problem trying to add a ZIP 250S (SCSI) to the end of a SCSI chain attached to my 1040STe: the ZIP ID (factory set to 5) does not show up when I boot the system or look for it using the ICD software.

My system is the 1040STe (4 meg RAM. TOS 2.06) with a LINK 2 connecting the DMA port to 2 Syquest EZFlyers (230 Mb each) in tandem to which I've just now added the Zip.

The Syquests have been working fine with a terminator after the LINK and at the end of the chain. They are ACSI ID 2 and 4, Lun 0. For a reason unknown to me both terminators are necessary, even though the Syquest manual claims the units are self-terminating.

Since Syquest is now defunct, I didn't want to be left with orphan units, hence the Zip. My HD needs are actualy pretty modest and I have a lot of room left on even the 230 Mb capacity of one Syquest. The second one is for ease of backup and the two perform well.

I have the Zip connected at the end of the chain as recommended in its manual. The Zip has a switch for adding termination, if it's at the end of a chain (which I have switched on), or for removing it if the unit is the middle of a chain.

My trouble is the Zip ID does not show up during the ICD bootup sequence, nor when I look for it with the ICD format program. I also tried the HDDriver ID program with the same negative results. So without an ID, I cannot use the Zip.

So right now I'm stumped. If you could shed any light on the problem, I'd very much appreciate it.

Well, I can't get passed the menu screen. Only the quit option works for
me! <no joke, sadly..>

While you mentioned it - the disapearing mouse pointer! Is there a patch
that I can download to stop this from happening? I've only had the
Falcon/MagiC OS for around a month now and the bugger has disapeared
numerous times! :-(

For boot it's OK with Cecile, but after I use HUSHI and Magic, so I have
patched HUSHI and Magic for put slow routines...
I have an old Conner 3,5 IDE 420 Mo since 4 years 1/2.

>----- snip ----- re: unique CT2B design => CPU speed == bus speed == 50 MHz

>>speed...
>
>Maybe, but it is still much faster than a 32 MHz TT. (I have one, so I know.)

Lot of benchs shows 300 %, but I have an example for acceleration:
I 'compile' Aniplay with Profimat (an old assembler during ST years) in
896 x 608 16 colors:
Falcon without CT2B or CT2B in normal mode: 7'45"
Falcon with CT2B (fast-ram): 1'25" => 500%
Results with nembench are better.

Regards,

Didier.

MetaDOS takes over the GEMDOS trap dispatcher from MagiC and therefore creates some problems under multitasking systems.

This indeed was the reason to throw out the GEMDOS level (creating MetaXBS), and moving the filesytem layer into MagiC|MiNT XFS (which is SPIN!).

So you probably don't want to even consider MetaDOS if SPIN+MetaXBS works (which it should).

Get the official release and the english documentation, both can be found from http://www.muenster.de/~reschke/soft_e.html, that should answer your questions.

Sorry, forgot the second question...

SPIN! contains a Mac HFS filesystem, but it currently only supports CD-ROMs. Extending it to read/write media is possible but would be much much harder...

Not mine either, but to be honest I'm a bit tired of people saying that
the 040 and 060 is "not compatible" (Have a look at kellis' CT2-page for
more nonsense (sorry kellis) about this), because my own experience is
quite the opposite.

> So, our taste in accelerators obviously differs, which is OK by me.

If the CT2 had been available when I bought the AB two years ago I don't
know what I would have bought. I was too conserned about compatibility,
and the chances are that I would have bought a CT2. It looks like the CT2
has an overall better design than the AB, but I'm very disappointed by
their choice of CPU and the missing through-port for the Falcon expansion
port.

> ones, and software emulation is not as fast as direct 68882 execution.

I don't agree with you here, my own experience is that the 040 with
882-emulation still is a lot faster than a 882. Also, you have to remember
that Motorola left out the more advanced stuff from the 882 because...

a) They're very rarely used compared to the more simple instructions.
b) They can all (almost) be replaced with simple lookup-functions.

I must admit that I've never done any real benchmarks here, I've only
noticed the huge increase in speed in things like Ikarus or Mario
Becroft's Asteroids compared to my TT.

>>and despite of the slower clock my AB outruns the CT2 in
>>all areas except ST-RAM.

> To be honest I doubt that. I have the benchmarks too, and according to
> them there is a strange assymetry in AB40 FastRAM access speed, such that
> write access occurs at less than half the speed of read accesses.

OK, here's my nembench-results:

NemBench v2.1 - precision CPU/FPU profiler.

Integer multiply (16bit) -> 2.925 Mips (~477%)
Integer divide (16bit) -> 1.187 Mips (~328%)
Linear (stalled) integer -> 32.000 Mips (~401%)
Interleaved (piped) integer -> 32.000 Mips (~401%)

Float multiply (64bit) -> 6.606 MegaFlops (~2492%)
Float divide (64bit) -> 0.878 MegaFlops (~507%)
Linear (stalled) float -> 6.770 MegaFlops (~1270%)
Interleaved (piped) float -> 10.922 MegaFlops (~2053%)

16bit read (100% hit) -> 63.091 MByte/sec (~803%)
16bit write (100% hit) -> 64.102 MByte/sec (~1065%)
32bit read (100% hit) -> 125.786 MByte/sec (~801%)
32bit write (100% hit) -> 128.205 MByte/sec (~1923%)

Linear 32bit read (ST-Ram) -> 4.455 MByte/sec (~83%)
Linear 32bit write (ST-Ram) -> 4.192 MByte/sec (~65%)
Linear 32bit copy (ST-Ram) -> 2.175 MByte/sec (~67%)

Linear 32bit read (FastRAM) -> 34.675 MByte/sec (~652%)
Linear 32bit write (FastRAM) -> 22.696 MByte/sec (~351%)
Linear 32bit copy (FastRAM) -> 15.117 MByte/sec (~468%)

Linear burst copy (ST-Ram) -> 2.262 MByte/sec (~70%)
Linear burst copy (FastRAM) -> 19.739 MByte/sec (~611%)
Linear burst copy (ST->Fast) -> 4.035 MByte/sec (~125%)
Linear burst copy (Fast->ST) -> 4.013 MByte/sec (~124%)

Compared to the results printed in AC#12 this is faster than the CT2 in
every aspect except ST-RAM. The AB is a poorer design than the CT2, has
slower RAM, extremely slow ST-RAM access etc. so the 040 is responsible

for the speed. A CT2 with a 040 or 060 would probably have been a *lot*
faster than this.

> So while AB40 is appx 3% faster than CT2B in reading FastRAM, it also
> appears to be appx 56% slower in writing to it. Ok, so reading is a

Not according to my tests. My AB is ~10% faster in reading fastRAM
(34.675Mb/s compared to CT2 31170), and the CT2 is 6% faster writing (AB
22696, CT2 24227). Please note that my AB has 64Mb, perhaps there is a
difference if it only has RAM in one slot?

> Looking at the results for cache hits rather than physical RAM access
> gives even stranger results. While the AB40 cache is lots faster than
> CT2B for read hits (as expected), it is also horribly inefficient for
> write hits.

?? It's *faster* when writing here! (125Mb/s reading, 128Mb/s writing).
Perhaps you tested an AB with the copyback-cache disabled? If it used
writeback-mode writes would probably slow down to fastRAM-speed, around
20-25Mb/s.

>>Believe me, the Videl can not compete with even the lowliest ISA
>>graphics-card, regardless of bus- and pixelclock.

> I'm not sure what you mean by compete. I can define resolutions so
> high that I can't read the text, and still have the screen updated
> at a satisfactory speed. What more do I need ?

I mean that a modern graphics-card has better resolutions, faster updates
and generally performs a *lot* better that the Videl. Remember that a real
graphics-card does lots of stuff in hardware that otherwise is left over
to the CPU. E.g. almost all VDI-primitives are handled directly by the
graphics-card, which takes a *huge* load off the CPU compared to the
Videl. Also, when the graphics-card draws these primitives 10-20 times
faster than the CPU it's obviously insanely fast (compared to the Videl
that is...). A graphics-card would be even faster on a CT2, both because
it would be clocked faster and because writing bitmaps to it would be
twice as fast.

> I'm sure it is nice, but I don't see it as necessary.

Perhaps not, but it's nice to have the option, right? With the current CT2
you don't have that. Hopefully Centek will come to their senses and
reintroduce it, especially when Titans new graphics-card is ready.

> Also, to be honest I think that your intense dislike for Videl is much
> due to the fact that the AB can not even access the ST-RAM as fast as
> the unspeeded Falcon could. That would make a graphics-card a top
> priority for AB users. I know it would be for me then.

I don't *dislike* the Videl, I was very happy with it for several years.
But it couldn't (can't) display more than 256 colours without slowing down
to a crawl, and the complete lack of hardware acceleration means that it
never has the potential to be really fast. And I don't like the idea of

wasting CPU on stupid things like drawing lines and fill squares when it
just as well can tell the graphics-card to do it...

Believe me, a graphics-card is a *huge* improvement over the Videl,
nomatter what speed you run the poor thing at :-)

> I know, but I think there are ways for Centek to modify the decoding
> logic such that no 'weird' mapping is needed. This might require
> 'reburning' the ispLSI chips, of course, but I think it would be a
> worthwhile update. I'd even be willing to pay a reasonable amount
> for such an update, if they do implement it.

Does the PMMU slow down anything? If not, then I wouldn't worry. Software
that use the PMMU will have to preserve the current PMMU-tree anyway,
because all the newer machines/accelerators (Milan, Hades, CT2, AB) use
the PMMU. MiNT is already adapted to this, and the current beta supports
memory-protection on 040 and 060 computers. I don't know if it works with
the CT2 yet.

1) Which BOS driver are you using when running SPIN?

2) Does your CD-ROM support exact positioning when audio grabbing
(ddstest.ttp will tell you...)? If this is not the case, you need a
program which knows how to do jitter correction when grabbing. The SPIN
archive itself does not contain a tool like that (why? because it's an
application, not a driver).

Hmmm. All you need to have to be able to access these CDs is a
multisession capable drive. I don't think that any drive sold in the
last 4 years came without that capability...

Hi Jo. You mean "x bit" as in executable? Well, I did a chmod 777
on it, (and yes, I know thats "all out" but I was just trying to
get the darn thing to work!) as well as pulling up its attributes
under the show info option from Thing. Don't know if you caught it
or if its even relevant but I can run this script from a vcon and
it executes and does what I've got it scripted for, just fine. PPPD
is not running it maybe? Dunno, but its baffling to me...(and you
know-it doesn't take much to do that!) <grin>

I don't disagree with you on any of the CPU-related stuff you wrote, so I
won't comment that. Please note that when I refer to the CPU clock on the
040 I naturally mean the BCLK.

> The PCLK of 68040 is simply a separate signal for the cycles that both a
> 68030 and a 68000 would derive from the halfcycles of CLK, so that is not
> a fair measurement of the processor speed, though it does indicate the
> resolution of timeslots recognizable by the CPU.

AFAIK the PCLK is only used internally for timing/syncing, the FPU, ALU
etc. all run at BCLK. It's been a while since I last looked in the 040
manual, so I could be wrong, but generally the BCLK is accepted as the
"true" clock for the 040/060.

> You seem to be missing that CT2B also runs Combel and Videl at 50 MHz.

Yes, I obviously do.

> The software updating the screen RAM (normally NVDI) should of course run
> in FastRAM, so that only the screen data needs to pass Videl.

But the point with a graphics-card is that you don't have to let the CPU
do this! The CPU only has to tell the card "draw a line from x,y to
x1,y1", that's all. Filling, blitting, drawing the mouse-pointer etc. is
handled directly by the graphics-card, which means that the CPU can spend
valuable cycles doing something sensible instead.

Also, because the graphics-card has it's own memory it takes a huge load
off the ST-RAM, and if it has VRAM the access to the card is not affected
by refresh-rates or resolutions.

>>The slowest mode on my 1Mb DRAM Nova (16 bit) is ten times faster than
>>the fastest mode on the Videl...

> Come on, the fastest Videl mode uses one 16 bit word per 16 pixels.
> There is no way you can have a hicolour mode at the same rez 10 times
> faster when fed by the same system. That should not even be true for
> an unaccelerated Videl. You must be mistaken.

Look above...

> That would mean an average access time 160 times faster, for a state
> where Videl is extremely lightly loaded. Nope, I don't think so. :-)
> Either you are mistaken, or I misunderstood you.

You assume that the graphics-card is only a DAC and some RAM-chips, but as
I said this is not the fact. If it was, then ofcourse a graphics-card
can't be *that* much faster.

> Possibly AC tested an early version which really did have 32MB limit.

Actually, when I read it closer it looks like the author assumed that the
RAM-limit was dependant of the number of SIMM-slots. I would be surprised
if this was true.

This just caught my eye.. are you saying an Atari utility exists to
allow my Falcon to read Mac CDs? If so, I would be very very happy if
you could point me in the direction of the Spin utility :-)

Is it a completely new driver? I'm using Extendos atm.

Thanks

Just a quick question - are these two still in development?

I know MagiC is regarded as being better, but I liked this combo on my original Falcon years ago.. Just curious :)

Hello,

I uploaded a new version of Web Page Creator. It is just a bug fix (a year late), the Text Link and Image Link menu options now work correctly. Nothing else has changed.. it's still the simple little program it has always been.. nothing fancy.

to get it..

It has. I have tried to use both that adapter as well as the one found with my old ICD-drive, but none of them will be able to format the SUPRA drive. I have changed some jumpers to edit the ID-number for the SUPRA drive, so it shoudn't interfere with the ICD/seagate-drive.

Regards,

Joakim

Do I have to use some SUPRA specific formatting program?`

You need Guy Harrison's SD TidyUp from htttp://www.swampdog.demon.co.uk

It's not a patch, but if you assign it to a function key in MagxDesk it will
sort out all sorts of droppings left by badly-behaved programs, including
getting your mouse pointer back.

Hi,

Sorry if this is a second post, I encountered some problems
last nite posting.

I have a CD received with a new modem I purchased, which calls
for Adobe Acrobat in order to read/print etc of the documents.
Is there anything for the Atari to read this stuff? I use a
TT, 4meg ST/l6meg TT, Geneva, Crazy Dots II board, NVDI.

Just another victim of Gates 'Plug'n Play'

Hello,

IMPORTANT

Please note that the Belgian ftp-site has a new IP.
One must use now "193.190.204.128".
In the near future the site will receive a proper DNS.
Due this major overhaul of the site I'm temporaly unable to do some new
uploads. I hope this will change very soon.

Regards
Martin

Actually, Acrobat is an Adobe product which began life on the Mac. I take a moment every day to thank Bill Gates - if it weren't for him I'd be out of work. As it is, his idea of 'Plug 'n Play' keeps me employed just keeping his crap running at work. What a misnomer - Mac is truly 'Plug 'n Play' but Windoze???? Nothing could be farther from the truth.

From: Ekkehard_Flessa@wun.maus.de
Message-ID: <199905091352.a37519@wun.maus.de>
Source record: 79067

Hallo Ronald!

RA>Is that problem fully repeatable ?

It surely is. Must be some interference with the Screenblaster driver. As soon as I select "original" in the resolution menu, the machine will boot up without errors.

RA>But seriously, don't waste too much time on the LAN ports at this
RA>stage, because I really do think they need new driver modules to work
RA>properly.

Well, at present they are working quite stable. Not much worse than the midi ports, I suppose. Will undergo some testing this afternoon in order to see which connection is faster in overall performance.
[later]
The midi connection is a little bit more stable, giving me transfer rates around 3000 cps. But WebLight (or STinG) did crash several times, MagiC reporting corrupted memory blocks, followed by error #-69 and forcing me to reboot the machine. That happened with both midi and LAN connections, so there might be some internal problem.

RA>This assumes that the Milan too has Midi, as all TOS machines should
RA>have.

There is a midi card available, but I don't have one (yet).

RA>If it doesnt, you can still use Midi between the Falcons, and Modem 2
RA>from one of the Falcons to Milan.

That's what I'm using right now. And it's reasonably faster, too because I can use 57k6 on this port. Will try 115k2, too.
[even later]
115k2 is working, too. WebLight on the Milan, CAB on Falcon #1 will result in download rates of around 8000 to 10000 cps for medium-size files (50k to 100k; don't have larger ones available).

Hallo Ronald!

RA>I'll accept that conclusion when you report error free WebLight
RA>operation over LAN ports with BNet disabled. I'm fairly certain that
RA>such an attempt will also end in bombs, however.

I had it crashing without BNET yesterday, but in a second attempt several 100kB
came through with few errors. This time with WebLight on Falcon #1 and CAB on
#2, as discribed in on of my yesterday's posts.
I did change another thing, too: replaced Dan's CAB.OVL 1.3015 by Olivier's
5.53. This seems to have cured the Problems with CAB on Falcon #2, as it didn't
crash today with both LAN and Midi connections.

>

Seems like Peter Rottengatter has been a little lazy when covering up for user misstakes. There are several other places where STinG accepts wrong data without complaining leading to very strange behaviour. If used correctly though, it works very well.

To connect with ppp via nullmodem simply activate the corresponding port in "STinG Ports Setup" manually. It will then start sending negotiation packets. I do this all the time to a Win-95 computer. The Dialer is _not_ needed.

Be careful not to save the port as active. If you do STinG will try to negotiate when booting and if nothing responds (pc turned off, like it should be :-)) within less than an hour STinG crasches very badly, at least on my setup.

2530. STunG: Solved - The Final Chapter!

Newsgroup: comp.sys.atari.st
Date: 1999-05-09 00:00:00 UTC
From: Tony Cianfaglione <ab616@chebucto.ns.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.990509160246.2502K-100000@halifax.chebucto.ns.ca>
Source record: 79074

Well, well, well....

I have been using STinG 115 and have had a devil of a time to get connected so I don't know if v120 is better or has solved the apparent 'bug' I discovered that was causing my grief.

I have used a 10 letter password for the past year to connect to my ISP via the PC (using Trumpet for Win 3.1), Apple II (using Marinetti for the IIGS), Amiga (using Miami for the A1200) and MacPLUS (using FreePPP) but was unable to connect using STinG with my Falcon.

I changed the password to an 8 letter password and it connected immediately - fast, easy and I had CAB up and running in seconds. Changing it to a 9 letter password, the connection and resolving hostname problems reoccured.

So.......

STinG 115 allows a 9+ letter password in the dialing script but only passes the first 8 letters through to the ISP, resulting in a failed link intialization. I don't know if this 'bug' (for lack of a better word) has been corrected in STing 116-120, but if anyone else who has been having the 'resolving hostname' problem is using a 9+ letter password, change it to 8 letter (maximum) password and see if it that helps.

I start my Falcon up to the desktop, I select STinG and watch the modules load in a line across the screen, I select STinG internals (in the control panels) and select Active, I start the dialer and select Connect. I now make a fast, great connection and start CAB (which I have a caveat about as well).

I use: MTU=1006, MSS=956, RWIN=3824 and PAP (although these may differ on your systems). When you start CAB, do NOT change the Home.html file to point to an online site. I do this with all of the other systems and have no problem but CAB 1.5 crashes with 2 bombs if I change the Home.html to anything but the German start-up page located on my C: drive.

See my next posting for problems with telnet.

Tony

2531. TelNOT!

Newsgroup: comp.sys.atari.st
Date: 1999-05-09 00:00:00 UTC
From: Tony Cianfaglione <ab616@chebucto.ns.ca>
Message-ID: <Pine.GSO.3.95.iB1.0.990509161810.2502L-100000@halifax.chebucto.ns.ca>
Source record: 79075

Once I am online with STinG 115 and have finished browsing the web with CAB 1.5, I close CAB and start Peter's Rottergarter's telnet application.

I select Open and it prompts me for a name. I type in: chebucto.ns.ca on port 23 and I get our usual login screen. I type in my login and press Return.

The cursor accepts the login name and moves to the next line and.....

Nothing!

No password prompt comes up as it should. I have tried this repeatedly with no luck beyond this stage. It wasn't until I could connect with STinG that I could try telnet but now I can't get it to prompt me for the password. It just hangs with the cursor blinking below the word: login.

I can select Close in the options so the application isn't crashed and I can reopen it again to the same results. I can close and leave the application and go back to CAB with no problem. What's happening here? Is ther a debug script that can be used to help?

The ISP is stumped on this one so here I am again asking advice.

Tony

Hi Tony,

first of, congrats to have gotten Sting to run at last!

second: this should be further investigated. Tell you the truth: when I
read this msg about your password I really thought: this guy's screwing
his ISP with a fake-password, now I know you're not...
It amazes me that they allow passwords like that... Demon over here for
sure won't accept it!

Anyway, it's about time this stuff is being cleared up by the author(s)...
First time I actually hear/read about it :-)

>ok I'll simplify my madness for everyone
>1024 * 1024kb=1048576 bytes=1Mb

Yes. But (according to something I read yesterday) according to newly
issued standards there is now a 'binary Kilobyte' and 'binary Megabyte'
with abbreviations Kib and Mib respectively. This is to differentiate
between powers of 10^3 for 'ordinary' units and powers of 2^10 for binary
units. So I guess we should all get used to writing Kib/Mib now. Or
should the 'b' be a 'B' to differentiate between bits and bytes?

The new version of aFTP (1.52b) is actually slower during uploads than
the previous version (this under STinG 1.20 and MagiC). For me the 'event
loop' fix has made things worse.

>original Falcon years ago.. Just curious :)

Hummm...
Good question indeed.

They are still avilable as new products for sure.
Dan also does a very good job with technical support and such on all
Gribnif products. As for upgrades, fixes and changes? No promises
that I know of. Sometimes it's just a surprise, and a new patch
comes comes along for Geneva/Neo.

Really, from what I can tell, Geneva is a super clean AES and a nice
addition to the utilities on the hard drive. It has fallen a bit
behind in that many developers still on the scene these days make use
of newer AES and Magic calls not present in Geneva. In this case,
it rarely affects the software working, but may cause unwelcome alerts
to be displayed via Geneva because it can't find such calls. Really,
I guess the software is at fault for not checking the AES first and
disableing those calls, but, anyway, that's the only problem I've
ever had with Geneva. Once again, such programs usually WORK fine
under Geneva aside from the dialogs that pop up here and there.
Example of this behavior are with later versions of QED, where accessing
the TOS clipboard via cutting and pasting present a dialog before
writing to the clip folder, and many applications, such as the STing
dialer that send some AES call before terminating that prompts a
dialoge. Again, it all 'functions' just fine.

If you're really wanting the Latest full support, you might look into
N.AES or MagiC.

On Desktops...
NeoDesk 4 is also falling behind thoe it's a wonderful desk top.
If you intend to use VFAT hard disk partitions for long file names under
MINT/N.AES or MagiC, then you'll wish to move on I'm afraid, as NeoDesk 4
doesn't deal with these yet (it works fine, but windows will display the
normal FAT file name, alla im.a.long.file.name would show up as IM.A).
NeoDesk also lacks some of the newer functions to limit memeory, and
some other flags supported by MagiC and N.AES/MINT.

More current Desk Tops out there are Thing, and Jenie (is that correct?),
and MagiC also comes with Magxdesk in the package. Magxdesk isn't bad,
but VERY basic compared to some of the relacements out there.

I have a 1040STe with 4 Mb of RAM that I use with a MIDI program called On-Stage. Also have Cubase. I am looking for a second machine. I need to find out more information on the various 1040STs. Ex. 1040ST, 1040STf..etc... Which ones can use how much RAM. I need more than 1 Mb to run as a MIDI file player.

Thank you very much in advance!

Hi Derryck,

DC>I've finished translating the strings in the binary of this well
DC>respected MagiC VFAT, large partition and (new for 2.8) BigDOS
DC>supported disk checker and defragger (thanks to Peter West for the
DC>initial work).
that's fine! Could you please send it to me via email? I'd prefer acompressed archive (LZH, ZIP, ARC, TGZ or whatsoever) and in UUE or MIME format.

Thus, I could hand it over to the author, Hans-Peter, who is offline for some time, but who would appreciate to be able to complete the version he spreads with an english manual.

As a french version is being made, three languages should be available soon, as is the 2.9 running on my TT since a couple of weeks.

As the program speaks English, which will not be changed or translated, please use the correct English spelling, "OPTIMIZE". Any correction or suggestion is welcome, and I promise to forward it to HP.

Final remark: If you agree, I'll send the 2.9 version to you, as soon as Hans-Peter declares it ready for being spread.

>Hmmm. All you need to have to be able to access these CDs is a
>multisession capable drive. I don't think that any drive sold in the
>last 4 years came without that capability...

to tell you the truth, I recently replaced a 2x NEC CD-ROM drive
with the 40x Toshiba. Although the NEC was claimed to be multisession
capable, I was never able to read those particular Enhanced-CD format
disks - which is why I was very pleasantly surprised when I popped
SURFACING and RHINOPLASTY in the Toshiba and was able to read the
software tracks. (Now, if only the makers of MoviePlayer and AniPlayer
can come up with updates that can read the .MOV files on these releases
- I wanna see and hear how Primus handled "The Devil Went Down To
Georgia"!)

There were other things flaky with the NEC as well - it would choke
on particular of my music CDs, and because I live in an apratment with
a slightly offset floor, I actually had to install it tilted inside my
hard drive tower case - the Toshiba installed without tilting, and so
far had only choked on one audio CD, almost all of my trouble ones work
on this drive. I think Nima mentioned at one time that earlier NECs can
be tempermental beasts at times :)

BTW, the NEC recently went to my mother this Mothers Day for her
Mac IIci, along with a bigger internal drive, the proper cabling, and a
copy of the This Is Spinal Tap CD-ROM box. :)

Hi Louis,

The ISP allows 9+ passwords and the STinG Dial script allows 9+
passwords so it never dawned on me that this was a problem. As I said,
the PC, Mac etc all sent the larger password through with no problem.
However, STinG is only passing through a maximum of 8 chaacters,
truncating the rest and my ISP is returning an 'invalid login' reply.

Well, no wonder!

If this indeed turns out to be the case, then STinG should be modified
to allow no more than 8 characters in its dial script regardless of what
the ISP allows or take the limitation out of STinG, whichever the
programmers decide to do. As I said, this may have already been done with
STinG 116-120 (I am using 115).

With that said and done, I whipped out my backup Falcon (I picked up a
second one for a good price) and installed STinG and CAB on that and it
connected with no problem, now that the password problem has been fixed.

> This one puzzles me too!

First of all, Marinetti isn't a password; it's the TCP/IP program for the Apple II, like STinG is for the ST. I used the identical password for each system in testing.

Secondly, you're right, the debug script did show the password as 10 letters but the ISP was only showing 8 letters received. We changed the password to an 8 letter one and the ISP reports receiving all 8 letters. The other platforms' PPP programs passed through the 10 letters and the ISP reported receiving all 10 letters. Could something in STinG have caught the last 2 letters prior to the final sending them out the modem lines?

> What ?!? And why ? (ST-RAM decelerator... :-)

The 040 and 060 does not support dynamic bus-sizing, i.e. it can not directly access ST-RAM. Motorola has a separate bus-sizer, but for some reason this is not used in the AB. Instead it has implemented this functionality in a Mach-chip, and apparently the implementation is not particularly efficient.

Note that this does not slow down the ST-RAM itself, so the Videl is not affected. Ofcourse, the CPU can't move stuff around in ST-RAM as fast as with a CT2 so graphics will be slower, but refresh-rates etc. are not affected.

The Mach-chips on the AB is it's weakest point, because they...

a) Does not implement bus-sizing very efficiently, hence slow down ST-RAM access.
b) Can't handle speeds over 40-42MHz.

The power of the 040 outweighs these disadvantages though, and I would really have liked to see a CT3 with a 040 or 060 :-) The CT2 looks like a much better design than the AB, but since Centek most likely won't kill the market for their Phenix (due sometime in 2003) we will never see a Falcon-accelerator with a decent CPU-upgrade from them.

Alright then, I will try HD Driver again with background DMA "off" and I'll run CAF_FIX as well. If this keeps the occasional hard drive freeze ups to under 30 seconds, and everything works after they unfreeze, then I guess I won't need ICD Pro any more.

Please understand that I am not trying to put down HD Driver, I just found it a bit annoying that a supposedly inferior product (ICD Pro) dealt with these freeze ups so much better (at least in _my_ particular setup). Anyway, thanks for the information. I'll report back after more testing.

Actually my greatest problem with the CHIPSxxx.HYP series is that there
is no well planned index, so one has to read half the HYP in order to
find anything. At present I only have CHIPS550.HYP and in it I can't
find any reference to a LAN hardware design error.

>> All of this indicates that the LAN sections of SCC.PRG are bugged and
>> in bad need of debugging or rewrite.
>
>Make that, the whole HS-Modem is bugged. On my Stacy, I cannot
>use MIDI.PRG with MiNT. It freezes the machine during bootup.

I disagree. The fact that one module does not work on one machine type
does not invalidate the rest of the package. It rather indicates that
there may be some difference in that machine which motivates a special
module to be developed, just like some of the new TOS clones need some
such modules that differ from the old ones.

Also, your problem needs more detailed testing. For example, does the
MIDI.PRG work better without MiNT ? Then it might just be a problem
with that MiNT kernel running on a STacy, and being triggered somehow
by an operation involving the Midi driver. Was this with or without
MiNTnet ? That could also play a significant role in this problem.

A lot more detail is needed as a basis for condemning an entire package,
without which most Atari machine are incapable of safe high speed serial
connections.

>Seems to me it's about time someone wrote some opensource, freeware
>replacement drivers for our platform.

Go right ahead ! I'm all in favor of that.

I simply think that HSModem can not be replaced very easily,
and that it is not quite as bad as you make it out to be.
IMHO the quickest improvement of the situation would be to
develop some improved HSModem driver modules.
(And even that won't be so easy.)

For this we need Harun to release the programming libs
needed to interface a driver module with DRVIN.PRG.
And of course, any programming examples for it that
he is willing to release. (Preferably real modules.)

Hi Jo Even,

To begin with let me say that I've realized that we suffer from a very bad case of split terminology when it comes to CPU clocking. 68040 designers and retailers use one set of terms, whereas those that peddle 68030 stuff use another set, and neither group is unbiased. And naturally we users are also affected by that difference in bias, reading their docs.

I've been sitting here, reading 'in stereo' from the microprocessor manuals for several hours now, trying to match the info with what I already knew, and some things I merely thought I knew (now discarded) concerning how the two processors are related.

The result is that this post is a lot longer than I had planned to make it, but I hope you will find some of the info interesting.

Please note that some of the stuff in this post is not aimed at you, but is rather intended for those like me, who are not all that familiar with 68040.

on Sat 08-05-1999 11:09 Jo Even Skarstein wrote:
>Ronald Andersson <dlanor@oden.se> wrote:
>
----- snip ----- re: CT2B does use a bus speed of 50 MHz
>
>This is not correct, the Falcon-bus runs "only" at 25MHz.

In that case you might as well say that a standard Falcon runs at 8 MHz. I was not speaking of a limited part of the Falcon-bus, but about the bus of the CPU itself. But in fact this 50 MHz bus does reach into the Falcon too, even though access speed of the components there are limited in some ways, and for various reasons.

Allow me to explain what I mean by bus speed:

On a 68040, all internal CPU activity is clocked bt PCLK, while all external activity (eg: bus access) is clocked by BCLK, but for various very technical reasons BCLK _must_ have half the PCLK speed.

Motorola state that for a 20 MHz CPU the PCLK cycle must be at least 25 ns (max 40 MHz), while BCLK must be at least 50 ns (max 20 MHz), which does indicate that they evaluate 68040 speed as max BCLK frequency.

On a 68030, all internal CPU activity is clocked by CLK halfcycles, while external activity is clocked by full CLK cycles equivalent to BCLK cycles, except that waitstate cycle insertion can be made with halfcycle accuracy. (That last sounds odd, but is clear from Motorola diagrams.)

Motorola also state that a 20 MHz 68030 may have a CLK speed of max 20 MHz, making it obvious that they evaluate 68030 speed as max CLK frequency.

These are fairly strong arguments for saying that CLK frequency is the bus speed of a 68030, equivalent to BCLK on a 68040, but an access example will show this clearly.

eg:
A 68040 in line burst mode fetches 4 longwords on a 32 bit bus in five full BCLK cycles, if no wait states are needed.

A 68030 in line burst mode fetches the same data in 10 CLK halfcycles, and if no waitstates are inserted this is the same as 5 full CLK cycles.

Consequently CLK speed of a 68030 is the same as its bus speed, which does correspond directly with the BCLK of a 68040.

The PCLK of 68040 is simply a separate signal for the cycles that both a 68030 and a 68000 would derive from the halfcycles of CLK, so that is not a fair measurement of the processor speed, though it does indicate the resolution of timeslots recognizable by the CPU.

For calculations a 68040 user might make based on PCLK he should simply replace that by 2*CLK when relating to a 68030 or 68000 CPU. So in this sense it can be said that a CT2B has a PCLK of 100 MHz, but its real speed should never be described as other than 50 MHz, its bus speed.

>The CT2 itself
>(CPU, FPU, RAM) runs at 50MHz though. This is basically the same design as
>the Afterburner and Mighty Sonic, except that the Afterburner don't work
>at speeds over 40-42MHz.

You seem to be missing that CT2B also runs Combel and Videl at 50 MHz. Please note that I don't mean pixel clock only, although that is raised to 50 MHz as well (with 32MHz clock moved to ExtCLK, unless disabled).

Obviously ST-RAM access can never be as efficient as FastRAM, since it has to go through Videl, which also makes its own access bursts. But even ST-RAM accesses are accelerated, though not by as large a factor as some other stuff. It is, however, accelerated by more than just the factor 50/32, as CT2B also reoptimizes various access cycles.

ST-RAM may be what you meant by speaking of a 25MHz Falcon bus, but that is not really correct. There are other things in the system apart from the ST-RAM, and none of those are accessed through Videl. In access to all of them the bus speed is 50 MHz, though they may need waitstates before they can respond.

----- snip ----- re: Videl is a pretty good graphics chip
>
>My experience with my Afterburner and Nova is quite the opposite. Even
>with a 25MHz bus the Videl is still lightyears behind my graphics-card.

I never said that the graphics-card were bad. What I said was that I myself see no need of a graphics-card as Videl fills my needs. It is

possible that my needs may change in future, but for the present I am
quite hapy with the resolutions and speed I get with Videl.

>Also, all access to videoram goes through the Falcon-bus, so on the Videl
>all graphics will be significantly slower in 16-bit than 256 colours,
>which again is a lot slower than 16 colours.

The speed loss per added plane increases as the number of planes increase,
that much is true. But it should not lead to significant slowness unless
using extremely high resolutions or unnecessarily high scan rates.

eg: Vertical rates above 100 Hz are not meaningful, as we don't see flicker
at such frequencies anyway. It's twice the frequency of ordinary PAL
television.

The software updating the screen RAM (normally NVDI) should of course run
in FastRAM, so that only the screen data needs to pass Videl.

>The slowest mode on my 1Mb DRAM Nova (16 bit) is ten times faster than
>the fastest mode on the Videl...

Come on, the fastest Videl mode uses one 16 bit word per 16 pixels.
There is no way you can have a hicolour mode at the same rez 10 times
faster when fed by the same system. That should not even be true for
an unaccelerated Videl. You must be mistaken.

That would mean an average access time 160 times faster, for a state
where Videl is extremely lightly loaded. Nope, I don't think so. :-)
Either you are mistaken, or I misunderstood you.

----- snip ----- re: supposed low CT2B FastRAM limit (it's 128 MB)
>
>128Mb?? According to Atari Computing it's only 32Mb, which isn't that much
>if you're into graphics or have a lot of stuff running in the background.

Their information is old. The boards were manufactured with that limit,
sure, but since the decoding logic is in-situ-programmable and the boot
ROM is Flashable, it was not so hard for Centek to fix when they changed
their minds.

Possibly AC tested an early version which really did have 32MB limit.

>128Mb is *not* pathetic, especially not since the AB can only handle 64Mb
>;-) (I find that a bit to limiting, but I can live with it).

Considering what we had before expanding our Falcons, I guess we can ;-)

>> myself find 32 MB FastRAM quite satisfactory, and since I still have my
>> 14 MB of ST-RAM I'm now using a total of 46 MB RAM. Why is that pathetic ?
>
>I have a total of 68Mb in my Falcon/Afterburner, and with everything
>loaded and running I have 50Mb free. That's without any apps at all...

I've currently got 25MB of FastRAM free, but that is with Everest and OKami
running of course (probably some fragmentation too), and MagiC, NVDI, and

all the other \AUTO\ stuff of course.

Hi again Jo Even,

I've just finished a pretty large post on the same subject as this,
and so I won't be as verbose in my reply to this one. I will reply
to this one assuming that the reader has seen the other, to avoid
having to repeat all that stuff here.

on Sat 08-05-1999 11:35 Jo Even Skarstein wrote:

>Ronald Andersson <dlanor@oden.se> wrote:
>
>> Whereas most other Falcon accelerators are limited to 40 & 20 MHz for
>> CPU and bus respectively,

Well, the above is not really the case of course, I was a bit mixed up
about various ways of describing speeds due to earlier misinformation.
I've now studied the 68040 manuals a bit closer. (see my other post)

>> CT2B is alone in having accomplished 50 MHz
>> for _both_. No other accelerator is meaningful to use with CT2B, as
>
>I find it *highly* unlikely that the CT2 drives the Falcon-bus at 50Mhz,

Well, that depends on what you mean by this. The fact is that the bus
connected to the Falcon is the same bus that comes from the CPU, and
that bus is most certainly a 50 MHz bus, by Motorola definitions.

>especially considering how difficult it is to run it at 25Mhz with other
>accelerators... Also, most of the chips on the Falcon (e.g. Combel) can
>not run at this speed. Not to mention the ST-RAM itself which barely runs
>at 25MHz...

The stuff does run, but obviously we can not expect all access to return
data without waitstates, on a bus this fast. That's not possible. But
since the bus is fast it is possible to optimize the accesses, since the
waitstates inserted have a finer resolution.

The ST-RAM is another story entirely, because it is not directly connected
to the CPU bus of the Falcon. It is only indirectly connected, through
Videl.

>I'm 99% sure that the Falcon itself runs at "only" 25MHz, while the CT2
>runs at 50MHz.

No. Both CT2B and Falcon busses run at 50 MHz, but naturally this does not
mean that chips which needed waitstates even at normal Falcon speed can
manage without such at an even higher speed. Of course not. And it is
equally obvious that some who did not need it at the old speed now may

need a waitstate or two to get along.

>The benchmarks published by Atari Computing also indicates
>that, as ST-RAM access is "only" twice as fast as on my Afterburner (which
>again is about 20% slower than on a standard Falcon).

I never said that miracles can be performed. Nevertheless, the acceleration
achieved is greater than the 56% to be expected from the Videl clock change,
due to optimized access means of CT2B.

>If you read the review in AC#12 it says:

That's a bit hard to do, since I don't have it. ;-)
But I do have equivalent benchmarks anyway.
(At least I think they are equivalent.)

>"During development, the CPU to fast RAM and Falcon motherboard interface
>was 25MHz, now it's always running at a full 50MHz, with wait states for
>slower hardware like the Falcon motherboard, rather than switching the CPU
>down to 25MHz for every access."

This sounds entirely correct to me. The bus does run at 50 MHz, and chips
which can't respond without waitstates are given such, just as on any other
bus design. What's wrong with that ? It's a standard design practice.

>> they are all slower and less efficient.

Well, the above may have been unwarranted. I know it is true of some,
but I should not have made so sweeping a statement when I am not really
familiar with all accelerators.

>>Also, since a 68030 CPU is used there is no problem with CPU
>>incompatibilities such as has been the case for accelerators based
>>on newer processors.
>
>I have a 040 myself and wouldn't trade that for a 030 at *any* speed...

I wasn't trying to talk anyone into doing that. The main point was that for
anyone who has chosen to install a CT2B it would not be meaningful to try
combining that with some other accelerator.

>I don't have one single problem with incompatibilies, but then I don't play
>games on my Falcon...

Games are not the only programs affected, but let's not get into some flame
war about 'my stuff is better than your stuff'. That was never my intention.

I did mention some drawbacks of using other processors, sure, but you know
that there is truth in what I said, even if you do not use programs that
suffer from it. I also mentioned several drawbacks of the CT2B, and
explained why I still think the advantages outweigh them.

So, our taste in accelerators obviously differs, which is OK by me.

>Anyway, the 040 is so much faster than a 030, and only marginally more
>expensive. E.g. it's FPU is about 15 times faster than a 882 clocked at
>the same rate,

I agree that there is a huge difference in speed for FMUL, FADD, FSUB,
and such other simple operations. But when you start needing 'trigs'
and 'logs' and such stuff, then the 68882 wins without a contest,
because the 68040 has none of it. In fact the number of FPU opcodes that
the 68040 does not support is much larger than the number of supported
ones, and software emulation is not as fast as direct 68882 execution.

But sure, I too would love to have those speedy FMUL operations etc.
They really are quite impressively fast. Too bad Motorola didn't
make a 68883, implementing the fast conversion routines of 68040,
because that is the main reason for the huge speed difference.

eg: For an FDIV operation the max 68882 calculation time is 20 cycles,
but it will additionally spend appx 100 cycles in converting the
input and output values. Which the 68040 does in 6 cycles !

>and despite of the slower clock my AB outruns the CT2 in
>all areas except ST-RAM.

To be honest I doubt that. I have the benchmarks too, and according to
them there is a strange assymetry in AB40 FastRAM access speed, such that
write access occurs at less than half the speed of read accesses.

So while AB40 is appx 3% faster than CT2B in reading FastRAM, it also
appears to be appx 56% slower in writing to it. Ok, so reading is a
more frequent operation than writing, but I think I prefer the even
speed distribution of CT2B.

Looking at the results for cache hits rather than physical RAM access
gives even stranger results. While the AB40 cache is lots faster than
CT2B for read hits (as expected), it is also horribly inefficient for
write hits.

This is really strange, since for the CT2B FastRAM write access is
faster than read access, and for cache the write hits are only about
18% slower than the read hits.

>> As for NOVA, I have no idea. What do you need it for ?
>
>Hehe, you've obviously never see one in action...

Right, I've never seen any graphics-card for a Falcon.

>Believe me, the Videl can not compete with even the lowliest ISA
>graphics-card, regardless of bus- and pixelclock.

I'm not sure what you mean by compete. I can define resolutions so
high that I can't read the text, and still have the screen updated
at a satisfactory speed. What more do I need ?

I'm sure it is nice, but I don't see it as necessary.

Also, to be honest I think that your intense dislike for Videl is much
due to the fact that the AB can not even access the ST-RAM as fast as
the unspeeded Falcon could. That would make a graphics-card a top
priority for AB users. I know it would be for me then.

----- snip ----- re: special PMMU usage for CT2B in FastRAM mode
>
>There's also other uses, like memory protection, or paging to prevent
>fragmentation. MMU-support for CT2 is IIRC in progress in FreeMiNT.

I know, but I think there are ways for Centek to modify the decoding
logic such that no 'weird' mapping is needed. This might require
'reburning' the ispLSI chips, of course, but I think it would be a
worthwhile update. I'd even be willing to pay a reasonable amount
for such an update, if they do implement it.

Is this from floppy? If so you have to change the path in STING.INF in
the auto folder. It must point to the \STING\ folder.

If you ever want to use the dialer there is a DIAL.INF that also needs
some editing.

Right. Empty dbf files. A remnant from an older versions, probably
U1.24. Delete those and your problem will be gone. See if the group(s)
is/are still listed in onews.def and delete those lines.

>Some quick peeks in other folders show that lots of groups follow exactly

Delete them all, .tix, .dbf and .idx files.

>ofind --Dbfchk alt.atari gave no feedback text at all
>ofind --Repi alt.atari gave no feedback text at all

Because of empty .dbf files and probably the fact that they are not
listed at all in onews.def.

>Now, as I see it the problem always occurs when importing news, and that
>makes me suspect oimport.ttp rather than OKami itself.

I don't think oimport imports any messages in those groups.

Mine does. You may rest assured that all modules dependent on changed
header files will be recompiled automatically. It is only in much
older versions of PureC that this isn't the case, but even then you
could configure it in the project files.

Hello,

Due to an internal IP-address change at the Military Academy in Belgium
the address of the Belgian FTP site has changed.
It now is impossible to connect to the server using the old address
193.190.205.13.
The new address is : 193.190.204.128
The directory is : atari/
A DNS name will be available in the near future.
In the maean-time we also changed the hard- and software of the server.
It now is y2k compliant !
Martin "Nightowl" Byttebier and I are checking out everything now and a
big update of the entire atari/ directory will happen in the future.
Don't expect any new software on the server the next week.

THX for your support.

Greetings,

I thought the Supra Drives had a host adapter in the case mate, if
yours does the it will take the same ID as your other ICD card and
that would stop it working I believe.

The other thing is both your Supra drive and Seagate drive could have
the same ID as well, and that would have the same effect.

> cable which doesn't
> have a 4K7 resistor on pin 11?

Iï¿½m not sure you understand all technical details.

Your resistor real are 3! resistors, connected one side to Red, Green,
and Blue. But you - only - need that if you like to have a monochrome
output only. Other (open) side of all 3 resistors are connected to MONO.
This smal network creates a MONO Signal out of R, G, B

(Or split Atari MONO Signal that you can use your r,g,b (VGA) as
simple Monochrome display) (Thatiï¿½s the other direction)

Also you have to watch the mono detect pin and if your display works
fine with the frequency that you atari deliver..
(Monochrome are on 71Hz! refresh)

If you only like to use color display, you doasnï¿½t need this resistor
network. (e.g with the network you must get a real whithe picture
background, if not, you have to play with the resistors..
(Best way is to have variable resistors of 5K)

(Hope that i understand all correct) :)

Yes, I take your point, Chris, and it's one I was very well aware of when broaching the subject. Nevertheless, if this company DOES provide free phone line access in exchange for some junk mail I, for one, am probably prepared to take the deal. After all, there are easier ways than this of spamming - you only have to look at your posts to see how many agents can get hold of your address without even trying!

Until at least one of us has a nibble we won't know whether we are missing anything worthwhile.

We shall see ... when I registered I was told that it would be a few weeks until I received the 0800- phone number and password. Hmmm ... just watch this space.

Yes, Ghostscript can read most Acrobat files, though it is a bit slow.
The latest version is the GEMmed GEMGS which you should be able to find
in most PD sources. A translated English version is reachable on Derryck
Croker's pages via:

http://www.cix.co.uk/~derryck/index.htm

>run as a MIDI file player.

All STs can have up to 4 Mb of RAM, but with the exception of the STe all require serious hardware hacking to attach it. If you can find a machine which has been upgraded already or was supplied as 4Mb (eg a Mega4) this isn't a problem. Getting upgrades for unmodified machines may be difficult these days and may be expensive if available.

STes take plug-in SIMMs so are much easier to upgrade. Some early ones used SIPPs (different connection method) which are more problematic, but adaptors are available.

To be fair to Kevin, it isn't in the printed manual (at least not here),
it's in the readme for NVDI-PC. Took me a while to find it after you'd
mentioned it was in the manual!

> really is!). Never mind.

I remember this discussion we had.
I for one do not have an AB40, so I can't confirm anything. All I can say
s what other users have experienced.
Of course, as you said earlier, you don't use older applications, not so
compatible applications, and no games etc.
This already limits the machines capability quite a lot.
The AB40 for the speed involved, for the money involved, for the no-more
support anymore of this card, for the limited compatibilty, for the
stability that you MIGHT not have experienced with your AB40 maybe.

I understand the choice for the 030 from centek, it makes sense for the
users.
Of course, saying a 060 or 040 is faster/more efficient than an old 030 is
quite obvious taken out of the context.

Once again, I consider you as a lucky one, and actually am happy for you.
Same apply, to all those happy magic users. Coz there are some.
But by no means I can recommend magic as a viable OS. By NO means.
For those who are happy with it, goood. All I can say.

I hope you understand where I am coming from.

> Ditto. I just got a bit upset about the AB-reference :-)
why upset? You should be happy that your AB40 works like a dream.

> To ST-RAM, yes, but the diffence in fastRAM is very marginal. Consider the
> fact that the CT2 runs at 50MHz while the AB only runs at 32MHz you see
> that the 040 is a lot more efficient.

Jo, do you have a nemesis with your AB40? or the AB40 alone?
Coz the prob with the AB40 afaik/r is the bus accesses.

In my opinion:
A machine can't only be seen by the CPU type or speed. If badly designed,
you lose.

CPU raw power is sometimes needed, POV, linux etc but doesn't make the
system more efficient.

Backward compatibility nowadays for OUR platform is very important because
we don't have that many people to code, to update, to create new software.
So we have to rely on some goodies sometimes.

How hard is it to find 040 CPU? are they as cheap as the 030 or close to?
Do you think Centek are just plain stupid to release a Falcon card with
"ONLY" a 030?

Jo keep up the good work with Taskbar... ;P

Rightly, the docs list the installation steps in order of difficulty, with the hardest first. I'm fairly convinced that I've broken the processor pin during step one, but it doesn't seem to have affected the behavior of the machine.

>No, I only have 32 MB of FastRAM, whereas the current maximum is

>on the CT2B board. A software patch exists to simulate acknowledge
>behaviour at (seemingly) 'spurious interrupt', but later I plan to
>install a hardware patch so that the real signal 'gets through'.
I have the details of this patch too, however I've yet to install it. Anyone else done this, any problems encountered?

>My CT2B unit needs more cooling than provided by the on-board fan,
>even though I also still have the original Falcon fan installed.
I've removed the top metal shielding (which in any case wouldn't fit over the top of the SIMM that I'd used), and moved the original Falcon fan to the inside of the top cover, glued in place with hot-melt glue over the PSU heatsink area. I've also replaced the CT2 fan (with System Solution's blessing) with a low-noise specimen...

>I now use a third fan, which is a bit awkward, but this problem
>will be less trouble if a 'tower' is used to house the falcon.
I have a desktopper waiting "in the wings", but I prefer to keep the original case, notwithstanding the need to put spacers in as per my other posting.

>Yoy can find lots more information on Centek's own homepage,
>at the URL "http://GARFIELD.SITECONSEIL.COM/centek/english/index.htm"
Where you can also download the installation docs so you can see in advance if you have the necessary skills!

Tell me Ronald, do you use CENTScreen together with MagiC and Thing or jinnee? I can't see how one is to access extended res's, the best I've been able to do is to use Videomod to choose the one I want, but I then have to go to "Change res" in the desktop's menu and pick any res from there before the change will take place. Maybe I'm missing the point here, but it does seem to be clumsy!

Absolutely right.

My first try was after using the convert.tos on my previous files, but
it has also occured after reinstalling from scratch and deleting the
entire newsgroup file tree.

After investigating, it looks like it is definitely O.prg that reads the
IDX files created by oimport, and erases them instead of updating them.
The files are deleted every time I open a newsgroup.

> I too have gotten some complaints about 'corrupted index' when importing.
> For me this has never struck any newsgroup that was part of my original

> _every_ time.

On my setup it happens on all newsgroups, and the mailbox too. It isn't
a corrupted index, the IDX file is wiped out by o.prg.

I've mailed a bug report to Jos too. Why I'm the only one with this
problem is beyond me. I'm using a stock 14Mb F030, Videl Inside, NVDI,
TOS 4.04, StinG, Newswatch, Popwatch.

I'll try this, but as I started with a clean newsgroup file tree, and
let O create a whol new hierarchy, I'm pretty sure that Okami 2.0 is
creating them. I have never had 1.24 on my system.

I think oimport is ok. On my system it's definitely O.prg that is
deleting my IDX files. After that, oimport does complain about not
finding the IDX files, but it's not the culprit.

Just don't use Atari formatted disks. Use DOS disks all the time. There
are several ST utilities that will format DOS compatible disks. DCFormat
springs to mind. Kobold does it too.

>loop' fix has made things worse.

Neil, same here: uploads to my own site at 3200-something cps, download of
a 100k file starts at 1800, after a few secs drops to 250 cps (this was
the same on 1.41 I used last)...
We gotta wait some more I think :-(

> run as a MIDI file player.

1040=1Mb
520=512K
Mega=1, 2 or 4 Mb (usually labelled Mega ST1, ST2 or ST4).

However, only the 1040/520STE are easily expandable with standard SIMM
memory, so if you need more than 1Mb, either get a MagaST2, MegaST4 or
any type of STE that you can expand to 4Mb (like yours).

Be sure to always get an SM124/125 monitor if you plan on using Cubase.

If you want a faster machine, get a MegaSTE (68000/16), a Falcon
(68030/16) or a TT (68030/32), all of which will happily run Cubase 3.0
or later. They'll choke on Cubase 2.0 though.

By the way, did you know that Cubase has it's own multitasking system
that allows you to run several MIDI apps simultaneously with a sort of
software internal MIDI communication interface. This is called MROS and
is detailed in the manual. Depending on the application, you might not
even need another ST.

Like I said before I use this all the time to connect to Win-95. I use
the standard dialup network with a dummy modem driver on the Windows
side. I guessed it would excpect a ppp server on the other (Atari) side
but STinG only acts as a ppp client(?). It works perfectly anyway.
Maybe FreeBSD is less flexible :-)

You may want to try SLIP as this does not require any negotiation at
all.

Well, not much more, I have Selectric as file selector, the usual
HSModem stuff. This is off of the top of my head.

I'll get back to you by email this evening and send you a complete log
file. I'll also give the beta 2.1 a try to see if it changes anything.

If you don't want to see any dialogs simply run GENEVA.PRG and not
GNVA_DB.PRG (the debug version)! Geneva runs very well here with STinG,
CAB, Popwatch, Newswatch, Okami, Aftp, QED, etc. I just tried to boot
with GNV_DB.PRG instead and got a single dialog about some flag could
not be set when starting Popwatch but that was all. QED did not
complain at all. Check if you have

setenv SCRAPDIR=C:\CLIPBRD

in the GEM.CNF file

I do have "Use GEM clipboard" enabled in QED v. 4.51

I have also tried Geneva+Freemint and it works most of the time. The
only real difference I have noticed is the importing and expiring runs
in the background when using Okami.

Latest info on ZIP 250S ID problem, using ICDBOOT.SYS 6.5.5:

Tried this setup: 1040 STE--LINK 2--terminator--Zip built-in terminator ON. Didn't work because ZIP doesn't provide power to the LINK.

Turned ZIP terminator off and added SyQuest EZFlyer after ZIP then added terminator to EZF. EZF booted normally; ZIP invisible, no ID shown. LINK getting power from EZF.

How do I get the ZIP to reveal itself (factory set ID5)?

Is the ZIP defective or have I overlooked something obvious and important?

Suggestions would be appreciated.

Chris Martin (cmartin@ti.com) wrote:

: Okay, I know I have heard this discussed here before, but
: does anyone know how the Atari PLIP differs from the Linux PLIP?

The original Linux (or actually PC-) PLIP used the status pins to
read data in nibbles. The Atari-PLIP uses the bidirectional parallel
port to read data in bytes. The Atari parports don't have all the status
lines, so the old PC-way doesn't work. However, the newer Linux kernels
also support a bidirectional PLIP mode. I don't know if the protocol is
the same as the MiNTNet PLIP, but that last one can easily be adapted
to make it Linux-compatible...
Anyone?

Ok, I will, but these group files were created after my conversion to 2.0,
so I am still a bit worried that it might happen again.

It created them on its own initiative. I have never wanted those groups.
I think it created them because of crossposted dupe messages, which is
one good reason why they are empty.

----- snip ----- re: Pure_C shells that don't support flexible dependencies

Good. It does reduce the risk of mistakes.

>It is only in much older versions of PureC that this isn't the case,

I suppose that the first refers to the PureC shell you use rather than to
PureC itself. AFAIK there is still no other way than project files to set
up dependencies for PureC without using a shell. Is there ?

Have you tried moving that driver to other places in the boot order.
This often has a great influence on various problems. Especially if
they have missed using XBRA protocol correctly for some exotic vector.

If they have done that, it must boot either first or last of all the
programs that use the same vector, though those are often unknown :-(

First or last depends on the type of error they make in XBRA handling,
and since that too is unknown you have to experiment. Also, if more
than one program uses incorrect XBRA methods (or none) for the same
vector, then stable coexistence may be impossible.

Btw:
Have you tried Videl Inside instead of Screenblaster ?
That is what I use, so I know it has no compatibility problems.
All its frequencies are configurable, so it should fit most pixel clock
patches. I needed that ability myself after installing CT2B accelerator.

>RA>But seriously, don't waste too much time on the LAN ports at this

>RA>properly.
>
>Well, at present they are working quite stable. Not much worse than the midi
>ports, I suppose. Will undergo some testing this afternoon in order to see
>which connection is faster in overall performance.
>[later]

But this in itself means that the LAN port does not work properly !!!
If it did work properly, Midi should not even be able to come near the
best transfer rates that should work reliably on the LAN port.

The very fact that they _are_ comparable means that the LAN handshaking
is not working at all, thus forcing you to use lower speeds.

>The midi connection is a little bit more stable, giving me transfer rates
>around 3000 cps. But WebLight (or STinG) did crash several times, MagiC
>reporting corrupted memory blocks, followed by error #-69 and forcing me to

>reboot the machine. That happened with both midi and LAN connections, so there
>might be some internal problem.

MagiC memory corruption problems strike everyone occasionally I'm afraid.
I sometimes suspect that it is the routine that checks for RAM errors
that somehow goes wrong and causes them to happen. :-(

----- snip ----- re: the other stuff you mentioned

Well, it looks to me as if most stuff works now, except for LAN-port
handshaking and some system instability. I think you may have to
experiment a bit with \AUTO\ boot order and ACC choices etc to find
stable setups. That has made a big difference to most others who
have tried it.

That proves my point. We need new LAN-port drivers.

>but in a second attempt several 100kB came through with few errors.

Proving that instability exists only requires one failure.
Proving that instability does not exist is impossible.
Proving that instability is tolerable requires extensive testing.

In the above tests you got a crash in 50% of the cases, and though
the number of test runs really does not allow proper analysis, the
crash you did get is a clear indication that it is not BNet-dependent.

Excellent. Still, I would stick to Midi for reliability, until Harun
(or anyone) can produce an improved HSModem driver for the LAN-port.

I don't use Cecile at all. I'm happy with HDDriver 7.51, and this works
fine for me. I don't want to use Cecile, because I want the generic SCSI
support of HDDriver for my BetaDOS BOS files. I've even tried that with
a 32-spin IDE CD-ROM as a slave unit, but I don't use this now as I got
nervous about the long cable needed. Such can cause errors for the IDE
hard disk, amd possibly even inject noise signals into the system bus.

>Falcon with CT2B (fast-ram): 1'25" => 500%
>Results with nembench are better.

All such tests include various types of access, which are influenced in
various degree by acceleration. That is why there is no 'right answer'
to the question of how much the speed gain is, since this will depend
on what the computer is doing.

That is also a difficulty in comparing two accelerators, since they will
normally have different strengths and weaknesses, so that different tests
can show either one as being superior.

>here...

DMA does go through Videl, and thus DMA communication with DSP does too,
but the DSP memory itself has nothing to do with ST-RAM. The DSP has a
static RAM area all its own. In any case DMA, DSP, and Videl chips are
all clocked at 50 MHz by CT2B, giving at least a 56% speed improvement
in their performance. The improvement will be somewhat higher for the
parts of their operation involving the CPU, since all CPU accesses have
been optimized to a greater degree than in an unenhanced Falcon.

----- snip ----- re: potential CPU incompatibilities

>more nonsense (sorry kellis) about this), because my own experience is
>quite the opposite.

I have seen her page, but I do not wish to discuss it now, since that was
some time ago. Actually I can't remember what she said about other CPU's
than 68030, since I was most interested in facts that concern CT2.

As for compatibility in general, we all know (or should) that the cookie
system defined by Atari does allow easy checking of the running processor
type, and that should be used by anyone programming with type dependent
code. Preferably to support any type, but if that's not possible it
should at least allow a graceful exit without bombs. And, of course,
whenever possible the best way to avoid incompatibilities is to simply
not use code that has such dependencies. (STinG uses this approach)

But unfortunately some programmers are still not aware of these things,
and continue to program for their own machine only, with compiler flags

set to use as much type dependencies as possible, without any checks.
Naturally those programs will only work on machines of that type.

Also, many older programs do not cater for any newer processors at all,
not even for 68030. In some cases they can't run at all on a modern
machine (eg: manipulating interrupt frames on stack), but often they can
be made to run with some adapting software, such as my B030 program
(on my homepage).

Now, I would love to have that work on 68040 machines as well, but I
have no way of testing it, and since this is a kind of program that
must use CPU type dependent code there is no way for me to make it
68040 compatible.

>and the chances are that I would have bought a CT2. It looks like the CT2
>has an overall better design than the AB, but I'm very disappointed by
>their choice of CPU and the missing through-port for the Falcon expansion
>port.

I actually see benefits of having a 68030 based accelerator, but opinions
will differ on that. As for the missing through-port, that is a real lack,
but not necessarily a fatal one. Other manufacturers of add-on boards also
have the opportunity to include a through-port on their products, and if
they do then the CT2B can be plugged into that

Having multiple add-ons makes it impossible to use the original case anyway,
and with a 'tower' case there can be room to make an extra set of expansion
connectors for the Falcon. This would be plugged into the original ones
using ribbon cable and connectors that include a through-port for CT2B.

There are solutions to most problems, if we just look at them with an open
mind. That does not necessarily mean that anyone will actually produce
such through-ports as a commercial product, but it is certainly possible,
and Centek themselves are the logical firm to do it. Only time can tell.

>> I agree that there is a huge difference in speed for FMUL, FADD, FSUB,

>
>I don't agree with you here, my own experience is that the 040 with
>882-emulation still is a lot faster than a 882.

For normal arithmetic the difference is huge, mainly because 68882 has
horribly inefficient routines for conversion of input/output data as
compared to 68040. For simple routines these conversions take up 90%
or more of the time spent per instruction by 68882. For more complex

instructions a larger percentage is spent on the actual calculation,
and then the difference is lesser.

>Also, you have to remember
>that Motorola left out the more advanced stuff from the 882 because...
>
>a) They're very rarely used compared to the more simple instructions.
>b) They can all (almost) be replaced with simple lookup-functions.

Those are simply their excuses for not finding room for it at the time
the chip was designed. Excuse 'a' is of course true to some extent, as
even programs that do need transcendent functions mostly use these in
functions that also use normal arithmetic.

Excuse 'b' however is a total falsehood.

Trig and log stuff replaced by simple lookup...?
No way. Not with decent floating point precision.

Did you ever see the type of trig and log tables people had to use before
electronic calculators were made ? Huge fat books they were, and still
only gave limited precision, totally unacceptable for such things as
raytracing, which is one of the things needing such stuff on computers.

For decent trig and log stuff you have to have fairly complex algorithms,
usually based on polynomials derived from Taylor-series analysis of the
specific functions. This normally means that a large polynomial with a
lot of FMULs and FDIVs will be needed to produce the result, which will
then take much longer to calculate than with a direct 68882 instruction.

It is true that for some purposes real transcendent functions are not
needed, and for such purposes simple lookup tabless can suffice, but
that sort of thing has no place in a discussion of FPUs, since it does
not concern real floating point operations.

>I must admit that I've never done any real benchmarks here, I've only
>noticed the huge increase in speed in things like Ikarus or Mario
>Becroft's Asteroids compared to my TT.

I have no argument with that. Quite possibly those programs use mainly
simple FPU arithmetic, and for that the 68040 is indeed much faster.

>>>and despite of the slower clock my AB outruns the CT2 in
>>>all areas except ST-RAM.
>
>> To be honest I doubt that. I have the benchmarks too, and according to
>> them there is a strange assymetry in AB40 FastRAM access speed, such that
>> write access occurs at less than half the speed of read accesses.
>
----- snip ----- re: your NemBench results

Strange. The arithmetic values, both integer and float, are almost identical
to those indicated by the NemBench file I had for AB40, but some other values
differ significantly. I am including the 2 affected sections below, so that

you can see what I was talking about.

16bit read (100% hit) -> 63.091 MByte/sec (~803%)
16bit write (100% hit) -> 8.849 MByte/sec (~147%)
32bit read (100% hit) -> 125.786 MByte/sec (~801%)
32bit write (100% hit) -> 17.730 MByte/sec (~265%)
--- snip ---
Linear 32bit read (FastRAM) -> 34.629 MByte/sec (~651%)
Linear 32bit write (FastRAM) -> 17.055 MByte/sec (~264%)
Linear 32bit copy (FastRAM) -> 11.397 MByte/sec (~353%)

These should be compared to your results below:

>16bit read (100% hit) -> 63.091 MByte/sec (~803%)
>16bit write (100% hit) -> 64.102 MByte/sec (~1065%)
>32bit read (100% hit) -> 125.786 MByte/sec (~801%)
>32bit write (100% hit) -> 128.205 MByte/sec (~1923%)
--- snip ---
>Linear 32bit read (FastRAM) -> 34.675 MByte/sec (~652%)
>Linear 32bit write (FastRAM) -> 22.696 MByte/sec (~351%)
>Linear 32bit copy (FastRAM) -> 15.117 MByte/sec (~468%)

The significant difference here lies in the write cache hits, as well as
in the write to FastRAM. Somehow you seem to be having write caching
at a higher efficiency than read caching, which should not be possible.
I don't understand that. But then, I don't understand the ridiculously
bad write caching results of the file I had either...

The other difference is that the efficiency contrast between read and
write FastRAM operations was larger in the file I had.

>Compared to the results printed in AC#12 this is faster than the CT2 in
>every aspect except ST-RAM. The AB is a poorer design than the CT2, has
>slower RAM, extremely slow ST-RAM access etc. so the 040 is responsible
>for the speed. A CT2 with a 040 or 060 would probably have been a *lot*
>faster than this.

I agree with most of that. Except that I must add that it is clear that
CT2B is faster for all kinds of write operations, both to FastRAM and to
ST-RAM and to other hardware.

It is primarily the improved 68040 cache that gives AB speed, closely
followed by the input/output conversion logic of the FPU section.

>> So while AB40 is appx 3% faster than CT2B in reading FastRAM, it also
>> appears to be appx 56% slower in writing to it. Ok, so reading is a
>
>Not according to my tests. My AB is ~10% faster in reading fastRAM
>(34.675Mb/s compared to CT2 31170), and the CT2 is 6% faster writing (AB
>22696, CT2 24227). Please note that my AB has 64Mb, perhaps there is a
>difference if it only has RAM in one slot?

That is possible, since I have no AB I just quoted values from a file made
by others. Still, if each SIMM has 32 bits I don't see why it should matter.
The CT2B only has one slot, so here no such variation is possible.

In any case, the relevant parts of the AB40 file I used are included above,
and here follows the corresponding parts for CT2B.

16bit read (100% hit) -> 24.630 MByte/sec (~313%)
16bit write (100% hit) -> 20.161 MByte/sec (~335%)
32bit read (100% hit) -> 49.140 MByte/sec (~313%)
32bit write (100% hit) -> 40.322 MByte/sec (~604%)
--- snip ---
Linear 32bit read (FastRAM) -> 32.483 MByte/sec (~611%)
Linear 32bit write (FastRAM) -> 38.778 MByte/sec (~601%)
Linear 32bit copy (FastRAM) -> 13.855 MByte/sec (~429%)

>> Looking at the results for cache hits rather than physical RAM access
>> gives even stranger results. While the AB40 cache is lots faster than
>> CT2B for read hits (as expected), it is also horribly inefficient for
>> write hits.
>
>?? It's *faster* when writing here! (125Mb/s reading, 128Mb/s writing).
>Perhaps you tested an AB with the copyback-cache disabled? If it used
>writeback-mode writes would probably slow down to fastRAM-speed, around
>20-25Mb/s.

You can check the figures I had in the sections included above, but since
I was not involved in the making of that file I have no idea what special
cache settings were active.

However, for general TOS compatible use, all data written must also write
through to the physical RAM, because the TOS code does not contain 68040
cache flushing before activating DMA operations. Anything which has not
been transferred from cache would be missed by DMA, as Falcon was not
designed for 68040, and therefore does not implement the snoop signals.

Thus the 'write-through' mode is the only one that can be safe to use,
and should therefore be used for comparisons. Possibly I am missing
something here, being unfamiliar with AB40 design, but I do not see how
other 68040 cache modes can be used safely. It is in any case the same
mode as is implemented by 68030, so it does give a fair comparison.

----- snip ----- re: ISA graphics-cards on Falcon

Ok, I see what you mean now, and I agree. But even so, at this time I do
not see it as something I need. I'll stick to Videl a while longer as
I have other, more important, things in which to invest my money.

>> I'm sure it is nice, but I don't see it as necessary.
>
>Perhaps not, but it's nice to have the option, right?

Certainly

>With the current CT2 you don't have that.

I disagree. You obviously think that a board for the expansion bus,
like CT2B should have a through-port, and I agree, they should. But
that also goes for every single graphics-card (or adapter for such)
that is made for this expansion bus. If they do have it, then CT2B
can be plugged into it. If they don't have it, then we can't blame
just Centek for it, now can we ? They are both to blame then,
Centek and that other manufacturer.

>Hopefully Centek will come to their senses and
>reintroduce it, especially when Titans new graphics-card is ready.

And why should not Titan fix it instead ? or both ?
or some third party making an 'expansion bus expander' ?

There are lots of possibilities here !

----- snip ----- re: your (seeming) dislike for Videl
>
>I don't *dislike* the Videl, I was very happy with it for several years.
>But it couldn't (can't) display more than 256 colours without slowing down

>never has the potential to be really fast. And I don't like the idea of
>wasting CPU on stupid things like drawing lines and fill squares when it
>just as well can tell the graphics-card to do it...

Ok, I see your points, except for the one thing about no acceleration.
My Videl is now accelerated by appx 56% for all purposes, with some
extra for CPU interactions (especially for ST-RAM access), and this
really does make a difference.

>Believe me, a graphics-card is a *huge* improvement over the Videl,
>nomatter what speed you run the poor thing at :-)

Perhaps, but I don't really need it, so I'd have to have a lot more
spare change lying around before investing in it.

>> I know, but I think there are ways for Centek to modify the decoding
>> logic such that no 'weird' mapping is needed. This might require

>> worthwhile update. I'd even be willing to pay a reasonable amount
>> for such an update, if they do implement it.
>
>Does the PMMU slow down anything?

It is not a matter of speed, but of physical addressing schemes that
do not comply with Atari standards (FastRAM), and of a PMMU scheme
that causes part of the logical address space to not comply as well.
($00xxxxxx is not made fully equivalent to $FFxxxxxx)
Those are serious compatibility issues.

>If not, then I wouldn't worry. Software
>that use the PMMU will have to preserve the current PMMU-tree anyway,

No they don't, because they can't. It is not possible to impose one
complex PMMU mapping system on top of another. It doesn't work that way.

Normally there can only be one such system at a time, since the PMMU
maps do control the entire system. That is why memory protection must
be disabled when you want to use OUTSIDE. Such can only coexist if
designed to work together, not when developed independently.

That is why the basic machine must be independent of PMMU in mapping
physical devices and RAM to addresses that comply with Atari specs.
This way all remains accessible, and TOS remains operational, while
the PMMU stuff is reprogrammed, and that can be done according to
a common physical map defined by Atari and valid for all TOS machines.

>because all the newer machines/accelerators (Milan, Hades, CT2, AB) use
>the PMMU. MiNT is already adapted to this, and the current beta supports
>memory-protection on 040 and 060 computers. I don't know if it works with
>the CT2 yet.
>
It is a stupid method honestly. It is really silly for each accelerator
to require a deviant PMMU mapping. NONE AT ALL should be needed in the
normal operation of any accelerator. That is how the one and only Atari
TOS machine designed for a wide address range works, the TT030.

When a TT has booted, the TC register as well as the TTx registers are
all zero. The entire address translation system is completely free
for add-on software to implement. There is no valid reason for not
booting the same way with a Falcon accelerator.

NB: I know the reasons given by Centek, but I do not consider those
reasons valid. There are other ways to solve all those things.

I already assumed that. It was one of the reasons I stated that not all of
the stuff I wrote was aimed for you,

----- snip ----- re: PCLK definition
>
>AFAIK the PCLK is only used internally for timing/syncing, the FPU, ALU
>etc. all run at BCLK. It's been a while since I last looked in the 040
>manual, so I could be wrong, but generally the BCLK is accepted as the
>"true" clock for the 040/060.

I think you are right. In some places the manual does state that PCLK is
used to control internal operations, but then when I check execution timing
for FPU and ALU all references are to BCLK cycles.

So: CLK == BCLK, and forget PCLK (except in hardware design of course)

>> You seem to be missing that CT2B also runs Combel and Videl at 50 MHz.
>
>Yes, I obviously do.

Actually it is obvious from the benchmarks, because Combel and Videl are
both involved in ST-RAM access, and since these accesses are accelerated,
those chips must be too.

Actually the original 32 MHz clock in my Falcon does not appear to drive
any hardware at all anymore, though it does go to the CT2B, so it can
use this timing when booting in 'compatibility mode', and for driving
the (optional) output to Videl's ExtCLK.

----- snip ----- re: running NVDI in FastRAM
>
>But the point with a graphics-card is that you don't have to let the CPU

>x1,y1", that's all. Filling, blitting, drawing the mouse-pointer etc. is
>handled directly by the graphics-card, which means that the CPU can spend
>valuable cycles doing something sensible instead.

Sure, but for some operations NVDI (or other driver) will still need to
transfer graphics data to the card. The operations you mention mostly
move around data already present on the card, or generates lines etc.

There will always be a need for blitting stuff from system RAM to the
card and for such operations it's vital that software runs in FastRAM.
This is especially true for an AB system like yours, since the ST-RAM
access is so slow there.

>Also, because the graphics-card has it's own memory it takes a huge load
>off the ST-RAM, and if it has VRAM the access to the card is not affected
>by refresh-rates or resolutions.
>
Actually this means that the card itself splits up memory much like we do
without it. The main difference is that we use ST-RAM also for general
purpose programs, but that is precisely what we should avoid to keep the
system efficient. Ideally ST-RAM should only be used for screen RAM and
DMA buffers, but due to TOS design we are also forced to use it for some
system variables and some other stuff.

>>>The slowest mode on my 1Mb DRAM Nova (16 bit) is ten times faster than
>>>the fastest mode on the Videl...
>
----- snip ----- re: NOVA 160 times faster...?
>
>You assume that the graphics-card is only a DAC and some RAM-chips,

I never assumed any such thing. You just assumed that I did.
(I hate recursive assumptions ;-)

>but as I said this is not the fact. If it was, then ofcourse a graphics-card
>can't be *that* much faster.

Actually there are lots of things for which it still can't be.

Whenever new data is to be transferred into the visible screen RAM from
elsewhere, it still has to be moved to the card somehow. Some few things
may be storable in 'extra' RAM space of the card, but when a program
wants to blit images of its own to the screen, they have to be moved
from normal system RAM to the card, by CPU or a special blitter.

That will never be 160 times faster than letting the CPU move it into
ST-RAM for display by Videl, which is how it is done by NVDI without
a graphics-card. In fact I do not believe it can be much faster at all,
certainly nowhere near the factor 160.

>> Possibly AC tested an early version which really did have 32MB limit.
>
>Actually, when I read it closer it looks like the author assumed that the
>RAM-limit was dependant of the number of SIMM-slots. I would be surprised
>if this was true.

Well, that is the equivalent of saying that all SIMMs have the same RAM
size, which is simply not true. They come in a wide variety of sizes.

Today 32 MB may seem like a dominant size, but this is only temporary.

In any case, according to Centek specs the current limit is 128 MB, and I
for one am inclined to trust that. But I don't have any, so I can't test it.

----- snip ----- re: STinG PPP unable to handle passwords longer than 8 chars

Sh*t!

I remember discussing with Peter the need for extending some of the editable fields in the dialer, for AT commands etc, but I had no idea that some stuff was limited to even shorter lengths elsewhere.

This is a serious error, but I'm afraid we have to live with it for now, as Peter still has not rejoined the beta list, or contacted me in private mail.

----- snip ----- re: is that a bug ?

It is a bug, so there is no better word for it.
The password should not be limited this way.

----- snip ----- re: has it been fixed ?

I have no idea myself if this has been changed in the new version. It also depends on the SERIAL.STX, since that is the module that contains the PPP implementation. Since the dialer itself does have long editable fields for both PAP_ID and PAP_PASSWORD, it is quite likely that SERIAL.STX causes the error.

----- snip ----- re: your successful login

Congratulations, I hope it keeps working for you now.

>When you start CAB, do NOT change the Home.html file to point to an online
>site.

Yes, that would not be good, because CAB was written mainly as an offline tool originally, and really expects a local file here. It should have the ability to use an online page too, but it doesn't and is not likely to be fixed since Alexander has more or less dropped his support for it.
(He's very busy with the various _real_ CAB versions, I gather.)

>I do this with all of the other systems and have no problem but CAB 1.5
>crashes with 2 bombs if I change the Home.html to anything but the German
>start-up page located on my C: drive.

That is not how it should be. I haven't used that page for years, and I do still use CAB 1.5 occasionally. Any local HTML file should do.
I'd better make some tests right away.

----- some tests later -----

There is a bug in CAB 1.5 causing it to bomb if its 'home page' has been set to some online file. This is regardless of whether that is on local net or Internet, and regardless of whether a server exists that can send the page or not. Any http: URL in the 'home page' setting field will cause CAB 1.5 to bomb (bus error). This field should only be set to a local file through the buttons available. That will not bomb, regardless of whether the file exists or not.

CAB 2.7, on the other hand, has no problems of this kind. It allows either local or online pages to be 'home page'. If started offline, or the page server is down or can't find the page for you, then you get an error report page instead. _But_ with STinG 1.15 the report for being offline will be somewhat delayed, because of a bug in TCP_wait_state, which was fixed in the latest TCP module, included in the STinG 1.20 release.

That delay before error report, when attempting to connect while offline, actually applies to most clients (not just CAB) and is one motivation for switching to STinG 1.20. (The major motivation is TCP_close improvement.)

I think that TelStar may be missing some VT100 escape codes, or possibly
misinterprets them. There are some escape codes that demand a reply from
the other end, and I don't think TelStar implements those. That would
lock up the conversation at that point, even though nothing is crashed.

>Is ther a debug script that can be used to help?

Not AFAIK.

> The ISP is stumped on this one so here I am again asking advice.

Get TelVT102 and try that instead.

Nicholas, Thank you very much for the information! Yes, I have fooled around with MROS multitasking. I want to get another machine for backup purposes, in case I have problems with the STE.

The OnStage program is a two-part program. One part is a simple MIDI file playback and editor which allows you to set up "sets" of 32 songs per floppy diskette. The second part turns the Atari into a dedicated MIDI file player for performance purposes. You can load a "set" of songs (up to 32) into RAM and play any of them instantly. Also, it allows you to load new songs while the current song is still playing, so there is no pause in the performance. That is the reason that I need more than 1Mb of RAM.

I don't think it is better to have timeouts so short that you can't
transfer large blocks of data at all.

Forgive my bad English, do you mean what software will run on a Falcon that
will _not_ run on MagiC PC ?
MagiC PC is (internally) an MC68000 emulator, so it will not run any programs
written for any higher processor. This is of course true for any DSP code or
any specific code for any Falcon's subsystem.

Nicholas, Thank you very much for the information! Yes, I have fooled around with MROS multitasking. I want to get another machine for backup purposes, in case I have problems with the STE.

The OnStage program is a two-part program. One part is a simple MIDI file playback and editor which allows you to set up "sets" of 32 songs per floppy diskette. The second part turns the Atari into a dedicated MIDI file player for performance purposes. You can load a "set" of songs (up to 32) into RAM and play any of them instantly. Also, it allows you to load new songs while the current song is still playing, so there is no pause in the performance. That is the reason that I need more than 1Mb of RAM.

2614. Help! SUPRA + ICD harddrives?

Newsgroup: comp.sys.atari.st
Date: 1999-05-10 00:00:00 UTC
From: Joakim H�gberg <gokmase@my-dejanews.com>
Message-ID: <7h6u05$5qq$1@nnrp1.deja.com>
Source record: 79031

Greetings all,

I have problems getting both of my harddrives connected at the same time. Basically, what I want to do is to attach both drives to the same SCSI-controller, but that won�t work! :(

I have:

1) One ICD (SCSI<-->ATARI) adapter with a 50 Mb SEAGATE

2) One SUPRA (SCSI<-->ATARI) adapter with a LP105S QUATUM drive.

The supra drive won�t be recognized with anything but the original adapter+driver, and if it _IS_ attached to the supra-adapter at the same time as the SEAGATE drive, then none of them will be recognized.

I would prefer to use the ICD-card, as it seems to be more compatible with newer drives, but I might be wrong on that one.

Please help!

-HELP! :)

/Joakim

2615. adding RAM to STf

Newsgroup: comp.sys.atari.st
Date: 1999-05-10 00:00:00 UTC
From: Chris Rupert <crupert@netrover.com>
Message-ID: <7h6qu6$485$1@goblin.uunet.ca>

There have been a couple of postings here which have confused me a bit. Is it possible to add more RAM to my 1 Meg STf (I think it has TOS 1.0)? Also, how much can I expect to pay for another meg or two of RAM?

Thanks

Chris

It's possible, but a little bit messy and expensive, as it requires an
extra upgrade board. You should contact your closest dealer for prices,
since you seem to be located in Canada.

I found that it was cheaper to get my hands on an STE (these use SIMM
memory) and upgrade that with standard RAM.

This is all detailed in the Quick FAQ.

I think PCLK is used to clock the instruction- and datapipes, but as I
said, I'm no authority on the internals of 68k CPUs...

> Sure, but for some operations NVDI (or other driver) will still need to

> This is especially true for an AB system like yours, since the ST-RAM
> access is so slow there.

Precisely, but if you watch the screen in front of you now you'll probably
notice that almost everything is generated by the VDI, and not bitmaps
blitted to the screen. And bitmaps are often "re-used" by the card as
well, e.g. scrolling or moving windows is very fast on my low-spec'ed Nova
because the card blits most of it around the screen. No ST-RAM access or
CPU required at all.

If you're talking about games or demos then the difference is marginal,
simply because every pixel you see is generated and blitted by the CPU.
However, if you write a 3D-game and load the textures to a good 3D-card
you get framerates impossible with any CPU. It's just a matter of where
you want the data processed. My point is that with the Videl you simply
can't do this, *everything* must be done by the CPU.

Btw. how much bandwidth do you have left when the Videl is running in
16-bit? In 640x480, 60Hz it will use almost 4Mb/s, which eats up quite a
lot of the original 10Mb/s. I still have 5Mb/s (7Mb/s with a bit of
hacking) regardless of resolution, I could use 1600x1200x24/120Hz if I had
a more modern card... Now, imagine the same card on a CT2 with 10Mb/s.

> Actually this means that the card itself splits up memory much like we do
> without it. The main difference is that we use ST-RAM also for general
> purpose programs, but that is precisely what we should avoid to keep the

> DMA buffers, but due to TOS design we are also forced to use it for some
> system variables and some other stuff.

But ST-RAM is just DRAM, so higher resolutions/refreshrates/colours means slower access for the rest of the system. With VRAM you don't have this problem, you always have full speed access to the video-mem regardless of how much bandwidth the graphics-card use.

> Whenever new data is to be transferred into the visible screen RAM from

> from normal system RAM to the card, by CPU or a special blitter.

> That will never be 160 times faster than letting the CPU move it into
> ST-RAM for display by Videl, which is how it is done by NVDI without

Ofcourse not, but have a look at your monitor: How much of the visible area is generated by simple primitives? I assume more than 80% of my screen is covered by these, and the CPU doesn't have to push more than a few hundred bytes to move a window. In such a "real life" situation my graphics-card is somewhere between 10 and 20 times faster than the Videl.

> a graphics-card. In fact I do not believe it can be much faster at all,
^^
You've admitted that you've never seen a graphics-card in action on a Falcon, and I can assure you that you're *very* wrong here ;-) In real life, I notice very little difference between my Falcon and my (now sold) 450MHz CeleronA with a ultra-cheap S3-card... (except that I only have 1Mb in my Nova)

> certainly nowhere near the factor 160.

But again you assume that the CPU has to shift every pixel to the videomem. This is simply not the case, unless you play games or use a GUI that entirely bypasses the VDI!

Thanks to the faster CPU (hence much faster processing of VDI-primitives),
the AB/Videl-combo is still faster than the Videl on a Nemesised Falcon.

> Investing in a CT2B can be made more gradual, since it makes the system
> faster in all respects even without any FastRAM, and there is no forcing

> some of the ideas because the 68040 will not allow itself to be accelerated
> as well as 68030 and 68060. At least that is what they said.

Centek seems to dislike the 040 a lot, especially before the CT2 was
released and the AB still was available they published a lot of crap on
their website. I can't see any reason why the 030 should be better than
the 040 speed-wise - run it at 50MHz on a CT2-based design and it will be
atleast 20% faster when accessing FastRAM, 300% faster cache, 2000% faster
FPU...

> This makes it likely that they will concentrate on 68060 stuff as the next
> step up from 68030.

For their Phenix - yes, but I can't see that they will make a 060
Falcon-accelerator.

> using ribbon cable and connectors that include a through-port for CT2B.

This is ofcourse an option, but it would definitely be easier, cheaper and
safer to just have those connectors on the card itself...

> The significant difference here lies in the write cache hits, as well as

Something must be seriously wrong here, the write-performance is pathetic!
Even with copyback-cache disabled my AB performs much better.

> in the write to FastRAM. Somehow you seem to be having write caching
> at a higher efficiency than read caching, which should not be possible.

According to the CT2-test in AC#12 the CT2 also was faster at writing than
reading.

> I don't understand that. But then, I don't understand the ridiculously
> bad write caching results of the file I had either...

It must be a cache-problem, perhaps a poorly configured driver.

> I agree with most of that. Except that I must add that it is clear that
> CT2B is faster for all kinds of write operations, both to FastRAM and to
> ST-RAM and to other hardware.

To ST-RAM, yes, but the diffence in fastRAM is very marginal. Consider the
fact that the CT2 runs at 50MHz while the AB only runs at 32MHz you see
that the 040 is a lot more efficient.

> However, for general TOS compatible use, all data written must also write

> something here, being unfamiliar with AB40 design, but I do not see how
> other 68040 cache modes can be used safely. It is in any case the same

It's very easy: Don't cache the DMA-buffer :-) I use copyback-cache all
the time, both with TOS, MiNT and MagiC and it's generally very stable.

>>With the current CT2 you don't have that.

> I disagree. You obviously think that a board for the expansion bus,

You are right (you don't hear me say that often...).

> Ok, I see your points, except for the one thing about no acceleration.
> My Videl is now accelerated by appx 56% for all purposes, with some
> extra for CPU interactions (especially for ST-RAM access), and this
> really does make a difference.

I don't doubt that, but what I meant with "hardware acceleration" is that
the Videl has no hardware that can process and render primitives, and this
is one of the major advantages of a dedicated graphics-card.

> It is not a matter of speed, but of physical addressing schemes that
> do not comply with Atari standards (FastRAM), and of a PMMU scheme
> that causes part of the logical address space to not comply as well.
> ($00xxxxxx is not made fully equivalent to $FFxxxxxx)
> Those are serious compatibility issues.

This is basically how the AB is implemented as well, the PMMU is used to
create a continuous fast-mem in the standard TT location.

>>If not, then I wouldn't worry. Software
>>that use the PMMU will have to preserve the current PMMU-tree anyway,

> No they don't, because they can't. It is not possible to impose one
> complex PMMU mapping system on top of another. It doesn't work that way.

Well, MiNT does that and it works. It will not work if the previous tree
was dynamic, but so far they're not.

> Normally there can only be one such system at a time, since the PMMU
> maps do control the entire system. That is why memory protection must
> be disabled when you want to use OUTSIDE. Such can only coexist if
> designed to work together, not when developed independently.

Memory-protection and Outside can't live together for one simple reason:
Both are dynamic. But there's no problem in inheriting a static tree and
use that when building PMMU-trees for individual processes (like MiNT
does).

> That is why the basic machine must be independent of PMMU in mapping
> physical devices and RAM to addresses that comply with Atari specs.

That's preferable, but not always possible.

> It is a stupid method honestly. It is really silly for each accelerator
> to require a deviant PMMU mapping. NONE AT ALL should be needed in the
> normal operation of any accelerator. That is how the one and only Atari
> TOS machine designed for a wide address range works, the TT030.

If everybody wrote clean programs instead of depending on the memory-model
of one particular computer (the TT) there would be no need to use the PMMU
for this. Nowhere does it say that alt-RAM begins at this and this adress,
in fact you can add chunks of alt-RAM at will.

(Btw. if there are any parts of your message I haven't commented it's
simply because you're right and I'm wrong and I *hate* admitting it...)

I have 'Save'ed Internals with 'Active' set. I use COPS as CPX server
where Internals is loaded automatically (along with a few others) at
start up so I can cut out this step.

>Connect. I now make a fast, great connection and start CAB (which I have
>a caveat about as well).

Whoopee!

2625. FS/T: Atari ST games [05/10/1999]

Newsgroup: comp.sys.atari.st
Date: 1999-05-10 00:00:00 UTC
From: VideoGameAdvantage@DittosRush.com
Message-ID: <37414e74.8179612@news.nls.net>
Source record: 79042

All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 05/10/1999

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site. Unfortunately, none are for the Atari ST computers,
at this time...

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari ST computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection is currently on-line! Unfortunately, there is no
list for this system (cartridge and CD based systems only).

I have the following Atari ST software for sale or trade.

Unless specified, all items are *NEW* and are still shrinkwrapped.

SOFTWARE:

ATARI ST COMPUTER:

New diskette(s) [still shrinkwrapped! Includes box and manual]:
$ 7.00 Advanced Dungeons & Dragons: Heroes of the Lance (SSI)
$ 7.00 Alcon (Taito)
$ 7.00 All Aboard! (Terrific Software)
$ 7.00 Arkanoid (Taito)
$ 4.00 Art & Film Director (Epyx) -- $4.30 shipping, due to
weight, counts as 1st item
$ 6.00 Art Library 2 (Melody Hall) -- RIPPED SHRINKWRAP!
$ 7.00 Auto Duel (Origin Systems)
$ 7.00 Awesome (Psygnosis)
$ 7.00 Battleship (Epyx)
$ 6.00 BCPL Compiler (MetaComCo) -- RIPPED SHRINKWRAP!
$ 7.00 Blockout (California Dreams)
$ 7.00 Bobo (Terrific Software)
$ 9.00 Bride of the Robot (Free Spirit) -- ADULT content!

$ 8.00 Bubble Bobble (Taito)
$ 3.00 California Games (Epyx)
$ 7.00 Championship Wrestling (Epyx)
$ 7.00 Crash Garrett (Metal Hurlant)
$ 6.00 Cyber Print (Antic Software) -- NO SHRINKWRAP!
$ 3.00 Death Sword (Epyx)
$ 2.00 Devon Aire in The Hidden Diamond Caper (Epyx)
$ 7.00 Dive Bomber (Epyx)
$ 2.00 Dragon Scape (Free Spirit)
$ 7.00 Dynasty Wars (Capcom)
$ 7.00 East vs. West Berlin 1948 (Time Warp)
$ 7.00 Eliminator (Hewson)
$ 7.00 Emperor of the Mines (Impressions)
$ 2.00 Final Assault (Epyx)
$ 7.00 Forecaster III (Greg Kopchak)
$ 3.00 GFL Championship Football (Gamestar)
$ 7.00 Golden Path (Firebird)
$ 7.00 Goldrunner II (Microdeal)
$ 7.00 Hoyle Official Book of Games (Sierra)
$ 7.00 Hyperdome (Exocet)
$ 7.00 Impossible Mission 2 (Epyx)
$ 7.00 Jewels of Darkness (Firebird)
$ 7.00 Jupiter Probe (Microdeal)
$ 7.00 Karateka (Br0derbund)
$ 7.00 Keith Van Eron's Pro Soccer (Microplay)
$ 7.00 Knight Orc (Rainbird)
$ 7.00 L.E.D. Storm (Capcom)
$ 2.00 Lands of Havoc (Antic Software)
$ 7.00 Last Duel (Capcom)
$ 7.00 Leander (Psygnosis)
$ 7.00 Major Motion (MichTron)
$ 7.00 Man Hunter: New York (Sierra)
$ 7.00 Man Hunter 2: San Francisco (Sierra)
$ 2.00 Mean 18 Famous Course Disk Volume II (Accolade)
$ 3.00 Metro Cross (U.S. Gold / Epyx)
$ 7.00 Moebius (Origin Systems)
$ 3.00 Paint Pro (Abacus Software)
$ 7.00 Phantasm (Exocet)
$ 9.00 Planet of Lust (Free Spirit) -- ADULT content!
$ 7.00 Police Quest 2 (Sierra)
$ 7.00 Powerstone / Elf Lord's Magic (Starsoft)
$ 2.00 Prime Time (First Row)
$ 7.00 Professor Craps (Scorpio Systems)
$ 7.00 Project Neptune (Epyx)
$ 3.00 Quadralien (Spinnaker)
$ 7.00 Rambo III (Taito)
$ 7.00 Red Lightning (SSI)
$ 3.00 Renegade (Taito)
$ 7.00 Rick Dangerous (Microplay)
$ 7.00 RVF Honda (Microplay)

$ 7.00 S.D.I. (Cinemaware)
$ 7.00 Savage (Microplay)
$ 7.00 Silicon Dreams (Firebird)
$ 6.00 Slayer (Hewson) -- NO SHRINKWRAP!
$ 7.00 Space Quest I (Sierra)
$ 7.00 Space School Simulator (CRL Group)
$ 7.00 Star Quake (Terrific Software)
$ 7.00 Star Wars (Br0derbund)
$ 7.00 Starglider (Rainbird)
$ 7.00 StarRay (Logotron Recreation)
$ 7.00 Stationfall (Infocom)
$ 7.00 Stunt Track Racer (Microplay)
$ 2.00 SwiftaR (Accustar)
$ 3.00 Techno Cop (U.S. Gold / Epyx)
$ 7.00 The Advanced OCP Art Studio (Rainbird)
$ 7.00 The Colonel's Bequest (Sierra)
$ 7.00 The Games (Epyx)
$ 7.00 The Guild of Thieves (Rainbird)
$ 7.00 The Pawn (Rainbird)
$ 7.00 The Sentry (Firebird)
$ 7.00 The Viking Child, Prophecy 1 (Imagitec)
$ 6.00 Tower Toppler (Epyx) -- NO SHRINKWRAP!
$ 7.00 Transputor (CRL Group)
$ 6.00 True BASIC (True Basic Inc.) -- NO SHRINKWRAP!
$ 7.00 Typhoon Thompson: Search for the Sea Child (Br0derbund)
$ 4.00 Warship (Strategic Simulations, Inc.)
$ 3.00 Winter Games (Epyx)
$ 7.00 Wishbringer (Infocom)
$ 7.00 Wizard's Crown (SSI)
$ 3.00 World Games (Epyx)

$ 7.00 Zero Gravity (Microdeal)
$ 7.00 Zork I (Infocom)
$ 7.00 Zynaps (Hewson)

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.20 for the first game and $1.10 for each additional game. Shipping for hardware and accessories depends on the distance that the order must travel. Foreign orders welcome.

Large orders will be weighed as a package, to reduce shipping costs.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very

rarely sell items that aren't working, but if I do, they are
clearly labeled as such.

3) Trade offers, in particular for items that I need, will be
considered (especially if the trade offer overwhelms me). I
collect for over 50 different systems, so please feel free
to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping
costs. Shipping cost depends on both the weight of the order
and the distance that the order must travel, unless a set
amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't
serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly
listed. There is no minimum order.

7) If you have a problem with the listed price, please remember
that nobody is forcing you to buy from me. I have been in
business since 09/05/93, so I have a good idea how to price
items. My personal philosophy is that something is only worth
what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order
-drawn from a U.S. bank branch-, or cash. Orders from outside
the U.S. are also accepted (also, please check out my want
lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your
order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in
(please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this
information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

Have not noticed speed problems here, but 1.52b still does not connect
right to my ISP. Neither did 1.51b. I have to hit reload everytime it
first connects. Went back to 1.5b again.

Do not click on connect in the dialer as the other side is not a modem!

On the fresh rebooted Atari open the "STinG Port Setup" cpx and click
on active for the actual port you are using (with fixed ip-address
set). Then open the Dialer and click on "Tools" - "Statistics". Now
select the actual serial port you are using. You should see "Sent"
increasing as STinG is trying to negotiate.

It _is_ possible to use the dialer to log in on nullmodem but why would
you want to do that?

Oh, that would explain it of course.

True, but the Falcon did not have any margins to speak of even without a
slowdown in reading and writing from screen RAM. With such a slowdown I
can well understand that most AB users will regard a graphics-card as a
necessity, and FastRAM as an absolute *must*.

Investing in a CT2B can be made more gradual, since it makes the system
faster in all respects even without any FastRAM, and there is no forcing
need to have any graphics board as ST-RAM access too is accelerated.

>The Mach-chips on the AB is it's weakest point, because they...

I have to agree. They should have gone for some other solution instead.

>The power of the 040 outweighs these disadvantages though, and I would
>really have liked to see a CT3 with a 040 or 060 :-) The CT2 looks like a
>much better design than the AB, but since Centek most likely won't kill

>Falcon-accelerator with a decent CPU-upgrade from them.

I do know that they have experimented with 68040 stuff too, but scrapped
some of the ideas because the 68040 will not allow itself to be accelerated
as well as 68030 and 68060. At least that is what they said.

This makes it likely that they will concentrate on 68060 stuff as the next step up from 68030.

Then again, it is also possible that the recent merger will add new ideas and approaches from the new team members, so we will just have to wait and see what they come up with.

Tony, on second thoughts:

I recall you sent a posting with the debug log from Dialer a few days ago,
IIRC it stated the sent password as "testforppp"... meaning all 10 chars
went out. So, somehow this remains a mystery...
If all your account(s) are with the same ISP, it couldn't be a length
problem with them, since "Marinetti" is 9 chars as well.
This one puzzles me too!

I wouldn't call it "new". It has been around for over one year.

Of course freeware. How could I forget when the game always reminds me
saying "Public Domain" ;-)

But it would be great if you could port it to something more modern.
Java might be more future-proof, but then maybe not...

BTW, you don't have a version of it where one has some more live at the
beginning? I am sorry to admit, but after all these years I never
finished Gilgalad. Level 5 was the best so far (although I am playing
more frequently the last weeks and maybe I'll make it this time...)

> Markus
> (who had many plans for a sequel to Gilgalad... ...maybe some day...)

YYYEEESSSS. PPPLLLLEEEAAAAZZZZZEEEEE!!!!!
%-)))))

BTW, on the disk where I have Gilgalad there were two other games from
you. A very good port of Space Invaders, and Anduril (I think that was
the name). Although I did not like Anduril in particular too much (but a
friend of mine, who hated Gilgalad liked Anduril, and is still No 1 in
my Anduril-Charts, grrr), it still is that type of games of that time
that I like. So I always wondered if you made more programs like those?
And maybe do you even have them somewhere??

Ciao, and thanx for this great game!

Claus

Yes there is a problem with the Belgian ftp-site. I couldn't
login either. The main problem is that the webmaster seems to be sick now.
I hope he will be recovered next week so he can finish his job.

If he buy the MiNT'98 CD he will have the KGMD/KEMD package and lots of
other MiNT stuff. Some things are rather outdated but it's a good start.

See my answer above. Here in Europe we can get MiNT '99 CD-ROM. It's
basically the same but it holds more up-to-date stuff.

This is how it's done on the AB as well, and a friend of mine also managed
to break this pin... He did fix it though, if you want to know how he did
it, just send me a mail and I'll forward it to him.

Maybe you can try an Epson FX driver?. SMM804 lacks some of the
graphics modes but it might work. Also there is the "Generic printer
driver" that should work. I think this driver will not use graphic
printout at all? The SMM has the Atari ASCI as default but several
national character sets are also available.

Nope, I don't know any atari stores in Vlaanderen or Wallonie.
The only I know is MABN in the Netherlands...
Maybe other belgian Atarian can give a positive answer but I boubt it.

>Thanks for all your help,
>Brasco

Hi

It's possible to get the 3.1, or is it the 3.10!, upgrade NOT from
Steinberg (I could never work that out!!!), but you will need the
original Cubase (obviously with dongle).

I do know that somewhere in the upgrades they changed the dongle, I
can't remember from which version.

If what you have is a NON-dongle version, then you have the version
produced by 'The Jolly Rodger Ripp Off Society'. Yes the roulette wheel
of the sequencer's... Now it works... Now it doesn't... Now it does...
Now it's gone again;)

Buy the original of which you'll get a nice dongle and... wait for
it.... a... a... MANUAL of how to use it;)

I give up. No, not because of you kellis, but because of the nitwit that has killed my connection two times in a row, both times just before I was ready to finish my reply. The first time I roughed him up a bit, and told him *not* to pick up the phone when I was on the net. "OK" he said, 10 minutes later the moron switched on his modem.

I'm going to kill him now, I'll be back tomorrow with (hopefully) a more stable connection.

i've got the folowing stuff for sale. all works fine.

atari mega 4 with matrix video card

taxan viking monitor. just under 19" diagonal viewable area. about 1300x1000 in mono. This will ONLY work with the matrix card. don't even try it with your pc/mac

sm124 mono monitor

slm 804 laser (the big one!)

megafile 30

maths co-processor card for mega. this will _just_ fit under the matrix card, but as i got rid of the cad/cam software, i also removed this module from the machine.

i use the setup for running calamus & its brilliant. you can run the monitor in 640x400 emulation or you can run both the atari & viking together (atari at 640x400 & viking at about 1300x1000) if the software allows it (calamus does)

i'm looking for about 250 pounds + carriage. email me privately if you are interested. because of the size of the equipment, it's not worth getting in touch with me if you are outside the UK

Hallo Vassilis!

VP>btw: Have you a working BNETwork with your normal desktop ?

What do you call a "normal desktop"?

I did never see more than unusable drive Folders from BNET on any of my Falcons.

Both of my Falcons are running MagiC 5.13. On the Milan, I have currently only N.AES available, so the xfs won't work.
I just tried it with BNET.APP started manually on both Falcon #1 and Milan. I am able to access files from the Falcon on the Milan, but the Milan doesn't pop up on the Falcon.
Benchmark: copy with Kobold (Version 3.5) 346795 bytes from Falcon to Milan in 55 seconds. Transfer rate is 6300 bytes per second. Connection via Modem2 respectively Serial2 at 115k2.
There was another error, though: the destination was a normal FAT partition. The resulting file was created in small letters rather than in capital letters, so Gemini wasn't able to access it. And even worse: the file is _not_ identical to the original. Many bytes have changed.
The filename will be correct when copied on the desktop, but the data will still be corrupted :-(
The Dialer's statistics window does _not_ report any dropped packets!

Hallo Ronald!

RA>Have you tried moving that driver to other places in the boot order.

No, I haven't. That Falcon is running very solid, normaly. The XFS is executed prior to the AUTO folder, as far as I can see. So, the order within that folder shouldn't make a difference as long as it's working without the xfs.

RA>Have you tried Videl Inside instead of Screenblaster ?

No, I haven't. Screenblaster uses an external (and programmable) clock source for the video timing, so Videl Inside might result in lower refresh rates or screen resolutions.

RA>I think you may have to experiment a bit with \AUTO\ boot order and
RA>ACC choices etc to find stable setups. That has made a big difference
RA>to most others who have tried it.

I had Falcon #2 up and running for several weeks without boot sometime last year. Used STinG and mainly CAT+StarCall during that period. So, the system in general is quite stable. Adding the network stuff makes it more unreliable :-(

>GS>The HD of my megafile 60 is sort of dead, can I replace it with just
>GS>any MFM hd ?
>if I remember well, the megafiles were RLL drives, which may be a bit different from MFM.

Not really. Most RLL drives are actually MFM drives, being modulated in a
different way, which increases the capacity by 50%.

Megafile 30 normally contains a 20MB MFM drive as manufactured for PC XT.
Megafile 60 normally contains a 40MB MFM drive as manufactured for PC XT.
(They often still have the black plastic frontpiece intended for PC case)

I've had a Megafile 30 drive, and added an additional drive which was a
completely unrelated 60MB MFM type, giving 90MB capacity with RLL use.
This gave me a total capacity of 120 MB for that 'box'.

There is room in the case for another drive, if that is not another 5.25"
type, which my 60 MB unit was not.

The important thing in installing a new Megafile drive is that the format
parameters must be known. Either to you yourself, or to a data file used
by the harddisk driver formatting utility.

I've only used ICD software to access Megafile drives, so I have no idea
how well this works with HDDriver et.al., but it did work fine with ICD.

>>
----- snip ----- re: broken processor pin during CT2B installation

The purpose of that pin, as used by CT2B, is to strap it such that the CPU
on the Falcon motherboard releases the bus permanently to the CPU on the
CT2B. You may have a total bus conflict on your hands if that fails. It
is possible that internal 'pulldown' stabilizes it in 'released' state,
but I'd hate to rely on that without definite confirmation.

>Some game sounds exhibit severe distortion?

That is true, and that may be because they require faster interrupt
service than the DSP_IRQ patch program can supply. If so the hardware
fix must be installed to fix it. But it may also be because the game
relies on an old 32 MHz clock for something, and can't compensate for
the fact that this clock now is 50 MHz. Some would then work better
in compatibility mode, but the main DSP clock will still be 50 MHz.
The only cure then is to skip DSP acceleration, and for such cases
I'd rather skip the game.

>>The boot mode used to enable FastRAM access installs a PMMU map that

>>problems, but I have a way of activating FastRAM in one of the other
>>bootmodes, so I use this instead.
>
>How do you implement this and what were the symptoms that caused you to take
>this step?

I'll start by defining the problem, then add my solution at the end:

Physical base address of CT2B FastRAM is $04000000 whereas $01000000 is the
standard base address of TT-RAM and the only address at which TOS will 'see'
an expanded RAM area automagically.

The reason for this is that Centek do not want TOS to see this RAM when it
is booting in compatibility mode or in TOS 4.x mode, as the unpatched TOS
can't deal properly with address ranges beyond 24 bits. So TOS would try
to use blitter operations directly into such RAM, though blitter address
registers only have 24 bits. That wouldn't work, so the RAM must be hidden
somehow for these cases, and Centek choose to do it by using a different
physical base address. (IMHO a poor choice, that I hope they will change.)

In TOS 7.x mode, CT2B boot code moves TOS into RAM, and patches it so as to prevent it from using FastRAM for cases where Falcon chips limited to 24 bit address registers are involved. Then, before starting TOS, a PMMU map is installed which remaps the patched TOS RAM to replace the ROM area, and remaps the FastRAM area to logical base address $01000000, so as to be recognized when TOS boots.

So far so good, but TT0 is also set up so that all addresses above $80000000 use transparent addressing without caching, as if all of that area consisted of I/O ports. It saves PMMU map space, and makes I/O accesses a bit faster. (But most I/O stuff needs waitstates anyway, so why bother ?)

This means that range $00xxxxxx and range $FFxxxxxx are not at all equal, as they were defined by Atari to be. It is perfectly legal to access RAM, ROM, and I/O of the standard Falcon map through either of those ranges, and many programming libs do define everything for range $00*, while others use both ranges mixed. So we must expect accesses to occur in either range.

The above could lead to serious instability, which is exactly what I do get. In TOS 7.x mode the system bombs quite often, but it doesn't in other modes.

My solution is to boot TOS 4.x mode instead, which uses a much simpler PMMU map. According to Centek this is the same as without CT2B. This map does define $00xxxxxx and $FFxxxxxx to use the same PMMU subtable, thus ensuring that everything, even the ATC cache entries used, will be fully identical for both ranges. In this mode the Falcon is as stable as ever, and yet all RAM and hardware is accelerated just as for the TOS 7.x mode.

So, this stable system starts to boot the harddisk, and runs XBOOT, which I use to select my boot setup. For all those where I want FastRAM I select a program I made named FASTEN32. This will simply call the GEMDOS function Maddalt, informing the system that an alternative RAM block exists at the address $04000000 with a length of 32 MB. (or 16, or 64, or 128)
After that the program simply terminates.

From that point on, the system will use the FastRAM, even though it is not based at the normal TT-RAM start address. Used this way all speed tests I've made match those I made in TOS 7.x mode, but the bomb frequency is no higher than it was before I installed CT2B.

There is one drawback to booting this way, and it is that no compensation is made for programs accessing the FDC while running in FastRAM. And FDC access is extremely timing dependent (internal delays in FDC). This means that diskette access may function badly in this mode, when made by software running in FastRAM. This can be fixed by clearing the FastRAM bits of such programs. They should not need those much anyway, since they must adapt to the physical speed of the floppy drive.

The effect also affects TOS, so when you plan to use floppy, you should not use GEMRAM or similar program to copy TOS to FastRAM.

I almost forgot, when you _do_ want GEMRAM to copy TOS to RAM in TOS 4.x mode (with or without FASTEN32), then you need to fix another bit in the PMMU map. The reason for this is that CT2B hardware does not generate a

bus error when a program writes to the TOS ROM physical address, like all
Atari systems do. GEMRAM and some other programs depend on that bus error
for testing if TOS is in RAM or in ROM, and will not relocate it to RAM
if it thinks it already is there. This is fixed by setting one bit in
the PMMU map, and that can be done by a small program I have made, named
WPTOSFIX.PRG . It just checks that a compatible map is active, sets the
necessary bit, and then terminates.

----- snip ----- re: Hardware patch for DSP interrupt acknowledge
>
>I have the details of this patch too, however I've yet to install it.
>Anyone else done this, any problems encountered ?

I'll do it fairly soon, and it looks like a pretty straightforward job.

>>My CT2B unit needs more cooling than provided by the on-board fan,
>>even though I also still have the original Falcon fan installed.

>I've removed the top metal shielding (which in any case wouldn't fit over
>the top of the SIMM that I'd used),

I cut away the shield areas that conflict with CT2B, but kept the shield
cage around the PSU. I didn't like the idea of highvoltage pulses so
close to the SIMM with no shielding between them.

>and moved the original Falcon fan to the
>inside of the top cover, glued in place with hot-melt glue over the PSU
>heatsink area. I've also replaced the CT2 fan (with System Solution's
>blessing) with a low-noise specimen...

Sounds OK, but it won't help in my case. I've tried all kinds of cooling,
and it is _not_ PSU heat that is the main problem. No matter how cool I
keep the PSU, I still get bombs if I don't direct a stream of cool air
directly at the middle of the CT2B board (the two ispLSI chips).

I really hate this, because it means I must blow dust straight onto the
CT2B, and it is beginning to look a bit 'hairy'. But it's the only way
I've found that works here. I really must get me a tower soon, so I can
arrange better cooling for the whole machine.

>I have a desktopper waiting "in the wings", but I prefer to keep the
>original case, notwithstanding the need to put spacers in as per my other
>posting.

I'd like to keep the original case to, but not as the cooling works now.
I guess I could try mounting a heatsink on the ispLSI chips too, perhaps
even with a fan of its own. That just might work.

>>Yoy can find lots more information on Centek's own homepage,
>>at the URL "http://GARFIELD.SITECONSEIL.COM/centek/english/index.htm"

>Where you can also download the installation docs so you can see in advance
>if you have the necessary skills!

Right. Everyone who is even thinking about it should definitely visit the site first. That's also where you'll find pricing info and contact addresses.

>Tell me Ronald, do you use CENTScreen together with MagiC and Thing or
>jinnee?

I've tried it but have gone back to Videl Inside now, because I get better control over resolution details with it. I can't duplicate the same rez under CentScreen, and then I'm not interested in using it. But I do test each new version hoping they'll improve it. (And they have, but not enough)

>I can't see how one is to access extended res's, the best I've been
>able to do is to use Videomod to choose the one I want, but I then have to
>go to "Change res" in the desktop's menu and pick any res from there before
>the change will take place.

That's the official way too, so you've got it right.
It's also done in a similar way for VI.

>Maybe I'm missing the point here, but it does seem to be clumsy!

It is, a bit, but it does work.

>
>This one's for the experts again, so Ronald (or Peter): ???

I think I know where the problem is, but I can't do much about it.

The dialer obviously knows what it wants to send in the PAP packets,
and that information is obviously correct. But somewhere on the way
to the PAP routines, or just inside them, the password string is being
limited.

But the main PPP routines are not in the dialer at all, they are in the
SERIAL.STX module. Unfortunately Peter has never described exactly how
the communication between dialer and SERIAL.STX works at this stage of
a connection. So I am not certain whether it is the dialer or SERIAL.STX
which creates and sends the PAP packets to the HSModen port driver.

Whichever it is that does it, I belive that it is this routine that has
an old string length limit that has been missed in later updates that
were intended to allow longer strings.

I'll see what I can do, but I have no sources of either program and no
contact with Peter, so I'll have to try to find this stuff by disassembly.
It is almost certainly just a byte constant that needs patching, but even
then it may take quite some time, just to find it.

This will be a good opportunity to see just how powerful TTDIGGER is.

>a 100k file starts at 1800, after a few secs drops to 250 cps (this was
>the same on 1.41 I used last)...
>We gotta wait some more I think :-(

Guys, what _exactly_ do you mean by "previous version" ?
Do you really mean "previous release", which was 1.51b,
or do you just mean "previous one you used" which could be older ?

I have already had feedback from lots of people, some of whom have tested
aFTP 1.51b quite extensively. All of them report exactly what I saw, which
is that aFTP 1.51b had an _absolute_ limit of appx 1024 CPS in uploads.
This was regardless of port and regardless of BPS, as long as that was
fast enough to reach 1024 CPS, else the BPS would limit CPS of course.

The event loop fix mentioned previously is simply a way to construct the
event loop so that no such _absolute_ CPS limitation can occur. And I
know that this worked in the special beta I got some days ago.

I have just tested 1.52b here, and I did get some inconsistent results with
my ISP, in that upload was fairly slow, but I did get download of a 112K JPEG
at a rate of appx 5000 CPS. When I tried both upload and download locally
over a 76800 BPS port I got around 6000 for the upload and 5000 for the
download. I did get slow uploads to the ISP, but this was midafternoon on
a Monday, so I didn't really expect any better.

Hmmm, its past six PM now, so it could be faster now.
I'll make a few tests, and continue this post afterwards.
----- several tests later -----
Ok, here's what I get now, with : Falcon--76800--TT--49333--ISP
UL Falcon to ISP appx 2000 CPS
DL ISP to Falcon appx 4500 CPS
UL TT to ISP appx 2000 CPS
DL ISP to TT appx 4500 CPS

UL Falcon to TT appx 6000 CPS
DL TT to Falcon appx 5000 CPS
UL TT to Falcon appx 6000 CPS
DL Falcon to TT appx 5000 CPS

All transfers were made with 2 JPEG files of appx 110 KB each.

As you can see it makes no big difference whether I reach ISP from Falcon
or TT, and for those connections DL is much faster than UL.

It also makes no big difference in which direction I open local connections,
but for those connections UL is much faster than DL.

The slowness in ISP connections is partly due to timesharing effects and
partly due to low priority of FTP tasks on the ISP system.

The big question here is why ISP_DL > ISP_UL but local_DL < local_UL ???
I'll have to think about that for a while.

In any case it is very clear to me that both download and upload speed
has been improved from what I could get either with 1.51b, or with the
intermediate beta I got, or with the preceding release 1.5b.
As I see it aFTP is on the right track again, after a recent 'slump'.

Joakim,

I had two drives hooked up to an ICD host adapter and one drive hooked up to a Supra host adapter that worked well together. The DMA addresses for each drive must be different for this to work.

I connected the DMA cable from the Supra adapter to the out port on ICD adapter and the computer to the ICD adapter in port. The system didn't seem to care that the drive hooked up to the Supra host adapter was formatted with the Supra software.

2673. Calamus printer drivers

Newsgroup: comp.sys.atari.st
Date: 1999-05-11 00:00:00 UTC
From: broncos@primenet.com
Message-ID: <7h8cdbasg1@nnrp02.primenet.com>
Source record: 78963

Hello,

Fellow atarians!
I am wondering IF anyone out there can tip me off to why printer drivers are so freaking hard to come by in the World of Calamus 98. I cant seem to get my HP 660 cse to print 600 dpi 4 color sep in legal is this common with inverse or what? All they do is send me the cdd's and thats it. Ive been asking to point to me someone who knows how to use that lame freaking printer generator which wont even work with theyre own cdd files. please help

Gene

>or do you just mean "previous one you used" which could be older ?

Ronald,

as stated, the last one I had fetched was 1.4beta4. Before that I was on
1.4 beta3, then a 1.3beta version and I think that was the first aFTP
version I ran. Before that I used Newsies FTP stuff.

Now first, my own ISP has some strange "habit" of not displaying the new
contents of the directory I'm uploading to after the upload (usually I
only upload to my own webpages); so once the file has been transferred the
program is waiting endless. aFTP can be killed from MagiC, next I start it
again and do transfer nr. 2 etc. Downloads: no problems.

I used to run a 14k4 modem until about 2-3 weeks ago. Downloads at max.
1650 cps, uploads the same (theoretically). I recall Newsie actually
reaching those figs. aFTP: I *think* the early version I used reached this
speed once, but I'm not so sure. That is on uploads. Note that I don't do
much uploads as compared to downloads :-) In downloading aFTP could reach
the max. on the modem, i.e. around 1650 cps.
Therefore it never occurred to me that uploads were perhaps limited to
1024 cps, since that could be a quite normal speed under the condx on the
net.

Since I got my new modem I started trying again: aFTP 14beta4 did the downloads to max. 3500 cps, and the upload started initially at 2000 something, after a few secs dropped to around 300 cps. This was on also a 120k JPG file.
So I fetched aFTP 1.52beta, tried to upload the 120k JPG (middle of the night, to my own homepage, the first rates it displayed were 1800something, then dropped to around 250 cps after a few secs again.
The download of the same file showed average 3260, with max. at peaks of 3500 something.

When I set up my homepages around a year ago I have used Newsie for the transfers, I actually have several files of 500-700k sitting there, and these all went "normal". I have added some 100-300 k files with aFTP later and these went "normal" as well, considering the use of a 14k4 modem.

I read about the uploading limits of aFTP, so recently I tested 1.4beta4 and now 1.52beta and found both kinda "choking": first rates displayed are high, then immediately decreasing to 250-300.
Dunno what's causing it, but it's all I can tell...

I recall having tried 1.4beta3 or 4 on Mintnet or Mint/Sting some time ago, which didn't have this limit. Bloody problem is that I don't recall: was it on Mintnet or was it on Sting :-) On 2nd thoughts: probably Mintnet, because I don't like Sting running on Mint (slightly unstable).

How did you download the hardware dongle ?

Seriously, it won't work without the cartridge dongle. If it does then
it is a cracked version, and I can assure you that no cracked copy of
Cubase works flawlessly. You'll be experiencing crashes and weird
behaviour every 5 minutes. Beleive me, using a pirated version of Cubase
is false economy.

Anyway, to transfer the files, just stick them on a 720K DOS formatted
floppy.

CAB 2.7 is commercial software from ASH, so you can't download it.
STinG 1.20 is available from Ronald's own site:
http://www.ettnet.se/~dlanor/

>up dependencies for PureC without using a shell. Is there ?

I never use the compiler without the shell, but I suppose you're
right: it's the shell that keeps track of changed header files.

2678. atari stuff for trade

Newsgroup: comp.sys.atari.st
Date: 1999-05-11 00:00:00 UTC
From: ethhoack ethandphi exbeess <ethh@enemy.org>
Message-ID: <WS.3737f336.000be840.ethh@enemy.org>
Source record: 78968

i'm willing to trade atari stuff for atari stuff.

at the end of the list, there is some other non-atari stuff to swap as well
but i'm only interested in atari stuff, don't propose other stuff or money.
meanwhile, i'm ready to buy lynx games and equipment.

i'm in belgium so consider the postal costs accordingly.

tags: games title have tags. these are: "b" to say it comes with the box; "d"
to say it comes with the doc; "f" to say it has no value to me and that it is
free to give away along with any other swap.

bargain by e-mail only.
===
i propose:

lynx games: ishido (bd).

jag games: kasumi ninja (bd), myst cd full version (bd).

n64 games: turok2 seeds of evil (bd), zelda ocarina of time (bd), doom64 (bd).

pc games (that work under plaindos): might & magic 4 (not the reedit) (bd),
realms (bd), ultima vii data disk (forges of virtue) (bd), ultima vii ii's
data disk (serpent seed) (bd), shadowcaster (bd), arena the elder scrolls
(bd), f-29 lightning ii (fbd), f-16 fighting falcon (game text in german)
(bd), ultima underworld i (bd), ultima underworld ii (bd), flying corps (fbd),
flames of freedom (bd).

pc joysticks: 2* quickshot v (2-buttons flight simulator stick with adjustable
x&y sensitivity), and 1x gravis gamepad (with dos drivers).
===
i'm looking for:

a tt-ram card fully fonctionnal that can carry at least 8mb, andor 4mb 30pins
60/70ns simms.

any lynx games, particularly: slime world, ms pacman, asteroids/missile
command (WILL PAY BIG CHUNKS OF MONEY FOR THAT LAST ONE).

any jag games, particularly: worms.

any st originals, particularly: starglider ii, superwonderboy in wonderland,
ghost and goblins, ghouls & ghosts, elite, castle master 1&2, viking child,
tower of babel.

mouses for atari.

in order to burn them and put the pictures on the destroy microsoft website,
free original microsoft products of high value with box and docs (you won't
ask for something in exchange for those).

In my case the previous version was 1.51b.

With 1.52b and a 28K modem, binary uploads bottomed out to a consistent 600cps. During the same session with the same test file (a 110K LZH archive), downloads topped out at around 2800cps. Uploads were twice as fast with 1.51b.

BTW, just like Louis I'm using the TT's Modem 2 port.

Ok, thanks! :)

I may try this if I can get hold of a DMA-cable.
However, it would still be nice to be able to use ONE adapter for both
drives. That has worked fine with other (newer) SCSI drives.

I have now managed to get ICD software to recognize the drive, but it won&#65533;t be able to format it, neither will HDDRIVER. Temporarily solution was to use the SUPRA adapter and SUPRA format the drive, but then I won&#65533;t be able to access it with ICD or HDDRIVER.

Hey I recently got a machine that has the Adspeed ST add on. This add on (by ICD) was made to accelerate the computer into a 16 mhz mode. (for those wondering)

For those that might have heard of this before, how do I get this to work? It has a switch in the back to go from 8 mhz to 16 mhz, but I've heard that some software drivers are needed. Does anyone know where I can get these drivers off the internet?

Any help getting this computer going would be appreciated.

2690. Atari 8-bit on ST at clock speed?

Newsgroup: comp.sys.atari.st
Date: 1999-05-11 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <37381810.71F6@geocities.com>
Source record: 78980

Hey guys! I have been a long time fan of the Atari computers but in particular, the Atari 8-bit machines. I'm having fun riding along with the ST, and I figure, if I can get an ST to think it's an 8-bit, I'll have the best of both worlds.

I'm impressed with ST Former and the cable system they have to allow a 8-bit drive to work on it. I'm hoping to get a cable and start loading (and saving) files on the ST. If nothing else, I'm thinking the ST will make a good backup system for the 8-bit. :)

Now here's what I've found so far... the ST (8mhz) will run the ST Former at roughly 29% of the clock speed. Not bad at all for a 8 mhz machine.
I would like to know first off, how well ST Former does at the 16 mhz and 32 mhz levels? Does it work on, for example, the TT's?
Does it ever get anywhere close to clock speed of the 8-bit, and if so, what kind of set up is required?

And, if you know of other 8-bit emulators for the ST that might work better, I would like to know also.

As an Atari hobbyist, I would like to have an ATARI computer (one that Atari made) emulating the 8-bit machine. I think it would be cute. But can an Atari built machine (ST through TT) handle it?

Thanks!

On a related note, how does one go about finding out how much RAM your STe has? I picked up a used one to run Cubase 3.1, and have heard this only runs on 2MB or more; but I would like to know if there is a simple way of checking this without taking apart the case.

>Softgee's Midplay ,it has run all but Positive Image
>Kevin
>
I'm not sure if a PC will do "internet better", but I think I've told you
that I can connect with both STinG and I-Connect and (this one I hate to
say ;-) CAB works great with Olivier's OVL 5.53 (which works fine with
both stacks). I do _not_ think I did something special to make both work,
except that the serial connection to my TT needs a cable with hardware
handshaking (RTS, CTS etc) regardless of what I select in the serial.cpx
or even window$ control panel. I think I told you that too.

The fact that you were connected with IConnect, shows that there is no
problem to access your internal modem. If you can't get anywhere from
there, makes me think of a strange situation a had once with DRIVIN for
the PC. I'll send you the one I'm using if you like (when I get back
home, next Monday). Then we can check again.

Hello,

I have been told that it is possible to boot *.IMG files from disk, effectively allowing you to 'upgrade' from the TOS version that your ST has on ROM. I have grabbed a couple of *.IMG files from the Little Green Desktop, and I have also found a little program called quicktos.prg. - but it doesn't seem to like the *.IMG files I've got.

I want to use TOS 2.06 of my STf (which has TOS 1.02 on ROM). Can anybody recommend a good TOS booter program that I can use?

Please Email me at paul@cylinders.demon.co.uk

Thanks,

Paul~

The ICD utilities can be configured to skip some SCSI IDs when scanning for devices. Have you checked that all IDs are being scanned? There is a utility (called something like IDCHECK I think - but it's a long time since I used it) which is used to check what is present at each SCSI ID, and I think this will tell you which IDs (if any) are being skipped.

Hope this helps

> What internet providers UK only, support Atari St running STing & CAB?
> Does anyone have examples of the dial.scr scripts for these?

Just about any ISP will do. Avoid people like AOL or Compuserve who use
non-standard protocols. Anything else should be ok.

Forget about dial scripts. I think this is where lots of people go
wrong. Just because the default.cfg and dial.scr files are editable
doesn't mean that they have to be editable. Lots of people go in there
and change things and then STinG will no longer work.

My advice is just to go into the STinG Dialer, and set the following
information from there:
-Phone Number
-Login
-Password
-DNS Numbers (even these are not always required)

This should be enough to get basically up and running, and doesn't need
tweaking unless you have serious performance problems. Read the docs for
more information, or the Quick FAQ for a quick setup procedure.

Hi,

I have an Atari TT030 and a Mega4St that I am interested
in running and learning Mint. Where can I get information on
Mint for a unix beginner like myself?
I did load Mint v.095 from Umich and it appears to be
installed correctly. Also where can I go to get the latest version
of Mint for Internet browsing and other applications?
One last question, how is the Whiteline MINT98 CD-ROM?
Systems for Tomorrow and Chromagic carry it here in the States
for $35.00. I was wondering how good of a source of information
it is.

Hello to everyone

I'm trying to compile a Linux-Kernel in order to get some modules working, which I don't have in the kernel that I loaded down from a linux-site.

I've got a Falcon with 14 MB Ram and I'm also able to compile the 2.1.131 kernel, so development-environment is okay.

When I compiled the kernel and boot it with ataboot 3.3, which gives me the same bootinfo as the kernel has, I get some pixels on the screen, changing rapidly and the printer prints something about a colour dummy device, but nothing like Atari builtin, as the kernel which works does.

Anyone can help me by sending my their Makefile and .config together or just telling me, what I'm doing wrong.

Thanks a lot

Andreas

Try sysinfo.prg. I think cubase tells you in the 'About Cubase' dialog.
The Thing desktop also has the info somewhere.

Cubase will run in 1Mb, but needs at least 2Mb to do scoring or run any
other extra modules.

You'll find some stuff that should do the job here:
http://www.freeweb.org/computer/vezz/atari/stsoft.htm

> I want to use TOS 2.06 of my STf (which has TOS 1.02 on ROM). Can
> anybody recommend a good TOS booter program that I can use?
>

You probably won't benefit much from this, as loading a disk based TOS
takes more time to boot, and lots of RAM. For TOS 2.06, we are talking
about at least 256K, probably more, so if this is on a 1Mb machine, you
won't have much RAM left for most programs, and you can just forget it
on a 520STF.

Your best bet is to get a real TOS switcher board that allows you to
switch from TOS 1.02 to 2.06.

> Please Email me at paul@cylinders.demon.co.uk

Sorry, I won't. Please read newsgroups you post to.

I'm afraid there is no central beginner's MiNT ressource at the moment,
and that is rather a shame.

> I did load Mint v.095 from Umich and it appears to be

> of Mint for Internet browsing and other applications?

That's old. What you need the KGMD/KEMD distribution from ftp.funet.fi.
It's a large package to download, especially if you want the MiNTnet
package too. Follow the instructions that come with the KEMD package.

Once you've got that, replace the old MINT.PRG with the latest MINT.

There is supposed to be a new distribution coming out soon, the NMD, but
Martin-Eric Racine who is responsible for this is still finishing it.
I'm personally waiting for this before reinstalling MiNT.

First go and get the latest mint on the folowing address:
http://www.cs.uni-magdeburg.de/~fnaumann/mint/In article

Then i recomend this addresses:
http://users.leading.net/~kellis/
http://sunos-wks.acs.ohio-state.edu/sysadm_course/html/sysadm-2.html
http://www.ugu.com/sui/ugu/show?help.beginners

I can tell you that i have installed the mint98 CD on my Hades 060
and it works very well.
The hades is now networked together with my PC and SUN.

Best Regards
Erik Hall

Matt,

I'm out of spare keyboards, but still have NEW Atari mice in stock. If interested, price is $25, with Priority Mail shipping included (within the continental U.S.).

Are you sure your old keyboard isn't repairable. The ususal problem with the old Mega keyboards was one or more of the cherry switches going bad (contact switch for each key). I'm pretty sure I still have a few left in stock. As I recall, they are around $2 each.

Source record: 78801

Hallo Vassilis!

VP>now there are more modern versions like jinnee, Thing, MagXDesk etc ;-)

Well, in my case it's Gemini. But that shouldn't matter. I did try using the mupfel only in order to see if it would report a more detailed error message.

VP>Well, that's a puzzle, if you can see the remote drive folders, that
VP>means you already have an open TCP connection with the remote computer
VP>and everything should work from then on.

That's what I expected, too.

VP>Have you tried only with your Falcons and you have problems, or the
VP>Milan (with MiNT/STinG) is somehow always between them ?

I've tried with the Falcons alone. That's not difficult because the Falcons are linked together via Midi (or LAN, depends) and one of the Falcons is connected to the Milan via Modem2.

VP>Sorry, this is not clear to me. How can you access files from the
VP>Falcon on the Milan, but the Milan doesn't pop up on the Falcon ?
VP>Where should the Milan 'popup' ?

Let me say it in other words... (guess english isn't the mother language for both of us ;-)

First, I started the STinG connection between Falcon #1 and Milan.
Second, I started BNET.APP on both the Milan and the Falcon. No XFS on either machine, but multitasking available through MiNT and MagiC respectively.
Third, I opened the newly available "P" Drives on both machines.
Fourth, I saw the Falcon1 entry on the Milan, but no entry on the Falcon.
Fifth, I tried accessing some files from the Falcon on the P: drive that resides on the Milan and was able to both copy files from there to the Milan's harddisk as well as from the Milan's harddisk to the Falcon.
Sixth, I encountered some kind of transmission problems as the transferred files were corrupted.
Seventh, I shouldn't always start these sentences with "I" ;-)

To answer your question, the Milan should pop up in the P: drive on the Falcon, as the Falcon does in the P: drive on the Milan.

VP>As for corrupted data, I'm afraid you have problems with the
VP>installation of STinG under MiNT.

Well, that might be the case, but I didn't encouter problems when browsing the web, downloading from ftp sites or whatever.

VP>(I suppose you're using BNET's drive under Kobold in GEMDOS mode).

I surely do, and it was only with Kobold that the file that was copied from the Falcon's D: drive to the Milan's E: drive wasn't capitalized by error. That should be a Kobold problem, as drive E: was _not_ in GEMDOS mode.
But the data corruption did also occur when I copied that same directly on the Desktop (Gemini 1.a) afterwards.

mit freundlichem Gruï¿½ aus Ahornberg

My Freeserve web page has only one file in it, which isn't displayed in the
directory unless I upload something - only when the directory has been
refreshed does the index.htm file get shown.

On 11 May 1999 15:02:17 , "David J Sime" wrote:
>What internet providers UK only, support Atari St running STing & CAB?
>Does anyone have examples of the dial.scr scripts for these?

I've used the following three ISPs with an Atari over the years:

CIX is very good for Atari users, both for internet stuff and the excellent conferencing facilities. There's around 250 Atari users on CIX. I use STing/CAB/NEWSie with CIX and it works absolutely perfectly! There's a lot of help available to get you up and running with STing etc on CIX. It took me just a minute or so to edit the scripts to get a first-time connection!

Zetnet are pretty good as well for internet only stuff, and there's around 100 Atari users. I used STiK with CAB, but STing will work just fine as well. There's quite a few knowledgeable Atari users that should be able to help you out here.

Demon is also accessible with an Atari, although I left because their service was abysmal a few years ago! I used NOS originally, then moved onto OASIS 1.35, then after severe connectivity problems ditched Demon and went to Zetnet! I vaguely recall using STiK and CAB with Demon a bit, but it was years ago!

Some of the free ISPs are useable with an Atari, though most seem to require that you use a PC (spit!) initially to sign up, but after that you can extract the script details and connect with STing and use the usual tools!

Price-wise CIX is the most expensive at about 17.50 a month, but that includes the unrivalled (IMO) conferencing and unlimited internet access, as well as the usual web site space. You can take a cheaper CIX option at 7.50 a month which includes 2 hours a month internet/conferencing, time above this is payable by the minute.

Zetnet is about 10 pounds a month.

Demon was about 11.75 a month when I last looked.

As far as connectivity, reliability and newsfeeds go, I've found CIX to be the best of the three. I did run CIX and Zetnet in tandem for about three months, and CIX was better overall. Can't say much about Demon because my experience with them was not good. They even admitted that all the problems were their fault, but refused to reduce my bill or pay compensation for all the wasted phone calls. I even have the letter in which they admit they were at fault!!!

I guess/hope they have improved since!

HTH a bit!

Kind regards

Mike Kerslake

> nor would anyone else have, I think.

Titan (Core) hinted that the real reason was that additional cards
would put too much load on the Falcon-bus, and that they removed the
through-port simply because it couldn't be used anyway. Ofcourse, Titan
is promoting their own accelerator...

> Writing to cache is different. The cache checks themselves are
identical,
> but for changed data the write must also change RAM. That is why
caching

This is how the 040 does it inn writeback mode, which indeed gives
poorer performance than copyback (which I always use).

> Well, it does have extremely fast caching modes, and other advantages,
> but the lack of efficient bus sizing works against them too. As for

Please note that Motorola has a separate, external bus-sizer which
essentially is the bus-sizer from the 030. Why this isn't used in the
AB is beyond me...

No, it simply means that the PMMU-tree installed by the driver (or
directly by the OS) marks ST-RAM as non-cacheable.

> It has never been a GEMDOS rule that any special consideration need
apply for
> DMA blocks, except that they should reside in ST-RAM and should not
use PMMU
> remapping for other logical addresses. The

Don't forget the FRB-buffer, which is provided in all TOS-versions that
supports alternate RAM. This doesn't cover all problems ofcourse (it's
only purpose is to buffer DMA-transfer to/from alternate RAM).

> >This is basically how the AB is implemented as well, the PMMU is
used to

special
> non-straight mapping, contrary to traditional Atari TT memory maps.

But it's strictly not necessary, as there's no rule that says that
alternate RAM has to be located at specific adresses, or even be
continuous. I'm not even sure if the original AB-drivers did this, as
I've only used Doug Little's driver.

However, on the AB there's no harm in doing this anyway as the PMMU is
already used for various things:

1. Set up the cache-mode for video-ram.
2. Disable data-cache in the FRB-buffer (or entire ST-RAM).
3. Move TOS to fastRAM and protect it.
...and 4: Joining the two RAM-banks at the standard TT-location.

> There are other (quite simple) methods that solve the problem better.

In hardware?

> MiNT may work with lots of things, but IMHO that is very much due to
the
> fact that most people run it as MINTNP.PRG, and not as MINT.PRG.

Without memory-protection MiNT doesn't touch the PMMU at all, so
naturally then there's no problem with even the most complex PMMU-
trees. I'm talking about MiNT *with* memory-protection, which currently
works with Milan and Afterburner (in addition to traditional systems).
It does not work on the Hades for one simple reason: The Hades' PMMU-

tree is set up by an accessory (!), which ofcourse is too late for MiNT.

> But with CT2B I don't think we need to be in that corner yet. Its
decoding

So
> the design is not locked in 'finished' state as long as any support
exists.

And since it only has one memory-bank you don't have to worry about
gaps either. What prevents you for not using the PMMU at all, and
simply install the fastRAM with Maddalt()?

> So it can, and I use that in a utility program I made for my CT2B, so
as to
> enable FastRAM access without getting the really weird PMMU mapping.
But it

Ahh, so it works without using the PMMU?

> But my main objection was not the fact that FastRAM starts at another
address,

But this is not the case if you don't use the PMMU? Or what?

specific danger in itself, as it
> means that any program resident in FastRAM will cause random crashing
if it
> attempts to clear or reprogram the PMMU mapping, such as a TOS
relocated to
> FastRAM will do (just as one example).

Not to mention that the reset-handler won't survive a reset if the OS
(MiNT or MagiC) was loaded in fastRAM! This is the case on my
Afterburner, although I've been able to fix that with MiNT since MiNT's
resethandler isn't needed in my case.

But Falke seems to be able to get both 040s and 060s for the Milan, and
there's still numerous 040-accelerators for the Amiga. Motorola still
mannufactures these chips (they're popular in embedded designs) so I
don't consider this a real problem - yet.

> > For their Phenix - yes, but I can't see that they will make a 060

Well, if the Phenix never sees the light of day perhaps they'll turn it
into a Falcon accelerator instead ;-)

160 is your figure, which is based on the assumption that every pixel
is moved to the graphics-card by the CPU.

> Ok, here are some more nembench excerpts for various resolutions I
use:
>
> Test resolution : 640x480x65536_colours 61.0 Hz Interlaced

> Linear 32bit write (ST-Ram) -> 8.880 MByte/sec (~137%)
> Linear 32bit copy (ST-Ram) -> 4.446 MByte/sec (~137%)

Very impressive, atleast until I noticed "Interlaced" ;-)

> Test resolution : 640x480x65536_colours 63.5 Hz Noninterlaced
> Linear 32bit read (ST-Ram) -> 5.152 MByte/sec (~96%)
> Linear 32bit write (ST-Ram) -> 5.674 MByte/sec (~87%)
> Linear 32bit copy (ST-Ram) -> 2.841 MByte/sec (~88%)

This is the figure I expected. Still rather impressive considering the
resolution. But as I said, with a graphics-card you'd still have
10MB/s...

> The last one is my normal work resolution, And as you can seem that
still
> leaves the ST-RAM access noticeably faster than on the max speed
resolution
> ST High on a normal Falcon (the reference rez of nembench).

Yes, but you're using a interlaced mode which cuts the load in half.
Are you using a RGB-monitor?

> This means that the most efficient use of the system will be achieved
if
> ST-RAM is only used for those dedicated things that really require it.
> (eg: Screen RAM, DMA buffers, hardware blitter operations.)

100% correct. I think everybody that has an Atari with split memory-
model use this. E.g. on my own Falcon the only thing I have in ST-RAM
is disk- and bitmap-caches.

> true in the limited context that it was intended for, but I also think
> this last part (not near 160) applies to overall performance. To be
> honest I think you do too, since you lowered that claim to 10-20
above.

But you seem to forget that my initial clame *was* 10-20 (IIRC), it was
you who multiplied this by 16 (i.e. "expanding" Videl-mono to Nova
16bit) and got 160! ;-)

Then I don't think you've talked to many 040-users. Try asking the members of the Falcon040-list how often they have to run with their caches disabled...

> Of course, as you said earlier, you don't use older applications, not so
> compatible applications, and no games etc.

That's correct, but I never said that those *doesn't* work. I never use them, so I can't tell.. I have a few old apps that I sometimes load though (mostly because I have old files only these apps can read), so I can guarantee that the following works *with* cache:

1ST Word Plus, Wordflair, EasyText, PageStream, Timeworks (!), DevPac2, GFA Basic, ST Knife.

As for games, well, these are real hard to get working on a stock Falcon as well, so I revert to one of my STs when I (very rarely) play some of my old games. The Falcon-specific games I've tested works, but then I've only tested Running and a Reservoir Gods-game I can't remember the name of.

To be honest, I have a lot more problems with programs that doesn't like my OS, the colour-depth or even the size of the screen. This is a much more common (and annoying) problem than software that only works on a 030, or not even on a 030 with caches enabled (a lot of older packers etc. use self-modifying code which breaks when cached).

> Jo, do you have a nemesis with your AB40? or the AB40 alone?
> Coz the prob with the AB40 afaik/r is the bus accesses.

I have a Nemesis which I rarely use, because I've never been able to get stable SCSI with it.

> A machine can't only be seen by the CPU type or speed. If badly designed,
> you lose.

Correct, but my point is that the AB - despite of it's poor design - is faster than the CT2 in many ways simply because it has a better CPU.

> CPU raw power is sometimes needed, POV, linux etc but doesn't make the
> system more efficient.

This is true if you have a PC with 66MHz bus and 330MHz CPU, but that's not the case with any of the current accelerators/clones. We still wait for the CPU to finish it work a lot of the time, just try displaying a long HTML-document in CAB, compile a large project, pack your C-partiton etc...

> Backward compatibility nowadays for OUR platform is very important
because
> we don't have that many people to code, to update, to create new
software.
> So we have to rely on some goodies sometimes.

Can you mention one application that runs on a TT or CT2 (in fastRAM) but not on the AB? Anyone? Cubase Audio is often mentioned in this context, but I know that atleast one person on the Falcon040 mailing-list use it.

This particular part of this thread reminds me of the "good, old days". When the TT arrived there was a lot of rumours about all the compatibility-problem, that the CPU-cache was trouble, "you can't even connect it to a TV-set!" etc. Ofcourse, I didn't know anybody with a TT, but all my Atari-owning friends (and I) had an opinion about it. Now that I own one myself I find that it's a lot more ST-compatible than even a stock Falcon...

Btw. does anybody remember those hardcore ST-fans that couldn't stand the STE because "it can't sync-scroll"?? Or "DMA-sound is cheating!"? I knew a few of those, they've switched to PC's years ago...

The Amiga-scene has always been more open towards new hardware than Atarians, that's partially why practically all Amiga-users have 040-, 060- or even PPC-based machines today.

And, if you really must have full Falcon-compatibility, then you can't find anything more compatible than a Falcon with an Afterburner and Geir Øyvind Vælidalo's CPU-switcher installed ;-)
(http://atari.nvg.org/hardware.html)

> How hard is it to find 040 CPU? are they as cheap as the 030 or close
to?

A very local store (just across the street from my house) has them in stock, they cost about USD90 (40MHz RC). I don't think they have 030s, but I believe they cost somewhere around USD30-40.

> Do you think Centek are just plain stupid to release a Falcon card
with
> "ONLY" a 030?

No, but as I've said many times before, they don't want a product that will compete directly with their own Phenix. If the Phenix doesn't sell (or they pull a "Wizztronics" again) they might change their mind.

>
Sure, MiNT needs a different XFS. Have you tried only with your Falcons and
you have problems, or the Milan (with MiNT/STinG) is somehow always between
them ?

>I just tried it with BNET.APP started manually on both Falcon #1 and Milan. I
>am able to access files from the Falcon on the Milan, but the Milan doesn't pop
>up on the Falcon.
>
Sorry, this is not clear to me. How can you access files from the Falcon on
the Milan, but the Milan doesn't pop up on the Falcon ? Where should the
Milan 'popup' ?

>Benchmark: copy with Kobold (Version 3.5) 346795 bytes from Falcon to Milan in
>55 seconds. Transfer rate is 6300 bytes per second. Connection via Modem2
>respectively Serial2 at 115k2.
>
Ok, this is more or less the speed I also get with 115k2 connections (with
or without BNET). Note though, that 'getting' a file from a remote is faster
than 'putting' it, and this has to do with MagiC/XFS/STinG internals.

>There was another error, though: the destination was a normal FAT partition.
>The resulting file was created in small letters rather than in capital letters,
>so Gemini wasn't able to access it.
>
Running BNET for single_TOS or without the XFS, paths are converted to
UPPERCASE. With the XFS, it is left to the OS. When you write to a remote,
BNET uses legal GEMDOS calls on the destination (like Fcreate, Fwrite etc).

> And even worse: the file is _not_ identical
>to the original. Many bytes have changed.
>The filename will be correct when copied on the desktop, but the data will
>still be corrupted :-(
>The Dialer's statistics window does _not_ report any dropped packets!
>
As for corrupted data, I'm afraid you have problems with the
installation of STinG under MiNT. I _never_ had such problems with BNET
(and no one has reported) even before TCP_close() was fixed, because BNET
keeps open connections all the time. I've copied many MBs of data from/to
MagiC PC, from/to my STE etc, etc (I'm a patient guy ;-) and never had
corrupted data. I really believe it's something else that causes this.
(I suppose you're using BNET's drive under Kobold in GEMDOS mode).

Don't you mean Reflex, from Titan Technologies (now Core Design)?
I have the same set-up, apart from your dream monitor. I use a full
colour multisync (ex betting shop) with the DIN monopin output feeding
the RGB inputs simultaneously. The software with the card (latest
version v2.4 free on titan-bbs.co.uk) allowing me full page (mono)
display with DA's Layout etc.

Bob King.

This won't work.

The best suggestion I have is, purchase a second-hand TT or another
TOS machine of some sort. There are plenty of those for sale here,
on this newsgroup, for almost nothing.

MiNT is mostly based on the BSD variant of Unix, so you might wanna
locate a copy of "Unix for dummies" and start with that. There are
some differences in MiNT, but most of that book still applies.

You can find the most up-to-date MiNT stuff on the Funet server.

Hi All,

I was given a keyboard which came off of an old 286 PC and was wondering
if it is possible to wire it so it can be used onto an STE?

The keyboard is a Philips P2815.

Thanks in Advance,

Gordy.

Hi

I have the above up for grabs. This is a very nice controller, and was expensive, it works on the Atari ST and Amiga and works out which machines it's on.

This what it says on the box, it also has a manual with it;)

"The ultimate optical controller. Precision and versatility.

Ideally suited for:
Entertainment software
Flight Simulation
CAD and Drawing
Desktop Publishing
Mouse emulation
Digital joystick games (Atari ST/Amiga only)"

It has 3 programmable buttons and comes in 2 parts; one part plugs into the joystick port and has an LCD display, and the other is a joystick that plugs into the other part.

I must admit that it did take me a while to get use to it. You can move the cursor around the screen, the speed of movement depends on how far you move the joystick; e.g. if you go all the way in any direction, the cursor moves much quicker than with a small movement.

I've only used this in the mouse port and can't say what it's like using it in the other port. Enough said I think.

I'm looking at around ï¿½30 GBP or I'll swap or do a part exchange on other gear.

>can get these drivers off the internet?

Well I've got a ADSpeed STe (same thing just configured for
STe) and don't have the software either but you don't need
it. The switch will toggle speeds and thats it. If your not
getting a boost with the switch perhaps a wire is loose or
the cable has a break in it. Replace cable. The software
drivers provide an alternative way of changing speed and
thats it.

Damn good accelerators, very compatible and even slightly
faster than a Mega STe. I wouldn't want to go back to 8MHZ.

>again and do transfer nr. 2 etc.

That effect may also have been due to the old TCP module. aFTP in particular
shows a marked improvement when used with the new module, though some of
its changes are of importance to all network APPs using STinG.

It is evident from your text that you have never tested aFTP 1.51b.
You mention lots of older versions, not realizing that their speed results
have nothing whatever to do with the limited upload CPS rate of aFTP 1.51b.
No earlier versions had such a limitation. And the new one has got rid of
it, as my earlier post about testing 1.52b proves.

It was the result of an update ATACK made to their event loops that made
efficient network access under STinG impossible. This has now been fixed.

I have always had fairly slow uploads with aFTP, compared to what I get
with Newsie, but in version aFTP 1.51b the CPS froze at appx 1024 CPS.
So at 76800 BPS, or a raw CPS of 7860, I still got an upload CPS of 1024,
even using a local server on my own network.

Now, with aFTP 1.52b, I get upload CPS of 6000 for exactly the same setup.
To my mind that is quite an improvement.

Maybe you are right. I found it a little difficult to keep track of what
was going on with oimport at first, so I may be mixed up there.

>>It created them on its own initiative. I have never wanted those groups.
>
>Then set "handle.xposts=0" in o.inf.

It is, now, but I think it was not so with the earlier version.

>>I think it created them because of crossposted dupe messages, which is
>>one good reason why they are empty.
>
>Version 2.0 of oimport shouldn't create empty .dbf files. If it does,
>I stand corrected, but I would like to see prove of it.

I'm not really sure when they were created, because I did not really
'dig' into the news\ subfolders until after I had switched to 2.0 .
I do know that the 'complaint' about corrupted indexes came after the
switch though, and with "handle.xposts=0".

In any case, I have now erased all the unwanted files and folders and have
also removed the corresponding lines from onews.def. After this 'cleanup'
I have not had any further error messages, so this was probably just a
side effect of switching versions. Possibly the index conversion program
did not realize that it would have to erase files of empty groups to keep
the new version happy.

>I never use the compiler without the shell, but I suppose you're
>right: it's the shell that keeps track of changed header files.

I never found a PureC shell I was happy with. The one I have can't even
launch the compiler directly under MagiC. It does so through a stupid
intermediate program which I find a ridiculous method. Yet they have still
added other handicaps to force people to pay money for it. This I won't
do, as the worst handicap (that extra program) would still remain.

So, what shell do you use, and where can it be found ?

>600cps. During the same session with the same test file (a 110K LZH
>archive), downloads topped out at around 2800cps. Uploads were twice as
>fast with 1.51b.

Are you sure about that ? The CPS display often jumps wildly up and down,
so even I have seen some such figure momentarily, but for longer files it
always evened out to _max_ 1024 CPS for aFTP 1.51b.

An average of 1200 CPS was impossible for me to achieve, using setups where
I now get 6000 CPS with aFTP 1.52b.

>BTW, just like Louis I'm using the TT's Modem 2 port.

I don't think that the port choice would matter much. I myself use the
serial 2 port of my TT for my 56K modem, as I prefer the available speeds
it has. I use Modem 2 for local networking to the Falcon.

I've been thinking of this aFTP speed problem most of us see, and I think
I know a solution that should improve speed even further. I shall suggest
another event loop modification to Jan Krivanek (of ATACK), that might
fix this.

2739. Floptical drive with disks for sale £42 including insured postage UK

Newsgroup: comp.sys.atari.st
Date: 1999-05-12 00:00:00 UTC
From: martin.w6@ukonline.co.uk
Message-ID: <37388e00.5983859@news.easynet.co.uk>
Source record: 78872
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Bare SCSI Floptical drive (20MEG storage per disk) also reads and writes to 720k and 1.44MEG disks. I.e. gives a high density drive to normal STs.

5x Floptical Disks 100MEG of storage.

PC SCSI card for use iwth Floptical.

Instructions etc.

All working 100%.

You will obviously need to mounti it internally or put it in case. If you need a 5 1/4 tray then I can supply one at £2 extra. You'll also need a SCSI interface of course.

Previously I mounted it in a external CDROM case.

I've used it on PC, Acorn, Atari ST, Falcon, Amiga 1200 with no problems at all.

Can load the five disks with software too depending on what you want.

Exceptionally good at reading 1.44 disks as it has a very precise and accurate mechanism.

You can not use normal disk copying software with it though as its not seen by the system as a floppy drive its a removable hard drive.

Will also consider swops for other Atari hardware.

ICD software does support Flopticals and I think HDdriver too. Ideal for someone with PC and ST for sharing information.

The PC scsi card is an 8bit isa card and probably a single device type. I've never used it as I've got an Adaptec SCSI card which I used instead.

Will split possibly. Flopticals £3.50 each, Drive £25, scsi card £4. all plus postage.

Also 520STFM with joysticks and games £45 including postage.

On 10 May 1999 13:24:55 , Uwe Seimet wrote:
>Paul Nurminen wrote:
>
>> And this makes HD Driver better because??????

Maybe it's per chance...
But since I've had a Falcon...
I've used Atari drivers, ICD Pro, and HD Driver (since version 5).
Since using HD Driver...I've not lost any data that a reboot didn't
manage to reveal. Before I'd dead clusters all over the place, and
many a file got too sick to recover due to CuBase burps.

CAF does a load of real time hard disk grinding...
It crashes sometimes...right in the middle of a take (as does any
digital recorders I've worked with in such an age and price range).
Just my experience, but since using HD Driver, I've had much more luck
at rebooting to find my data still there and useable.

Does that have anything to do with the time outs and such? I dunno...
One fact remains however...
There's not much to choose from if you wish to move to other partition
types, and see constant improvments, further support, and very good
coustomer relations.

This has been a very interesting thread however...
I do hope it leads to some improvements on solving the Falcon SCSI
time outs. I guess I'm lucky in that I RARELY see them unless I'm
running high speed modems and Direct Memory access at the same time.
In fact, I've never been able to get much speed out of the serial ports
on this particular Falcon. I'd have to agree with Uwe that the focus
is a hardware one. So...what are some patches that may help? I'm eyeing
a Centurbo II pretty hard. Any proven success going that route?

It seems to me, that the Falcon just doesn't have the bandwidth it needs
across the bus. Drop to 2 colors, and all those problems go away for me.
Don't use serial ports, and I can hop up to higher resolutions and the
problems go away. Try to use it all together, at the same time...and
well...glitches.

I'm still very impressed however...since the system was based on designs
never meant to use all these resources at once. I've a Pee Cee, and had
a Mac that came out near the same time as the Falcon...and they're
pretty much door stops even compared to my older ST machines. I doubt
it's due to hardware, as much as the lack of die hard hackers who
continue to support and develop software for it. Yep, I'd say the
Atari investment is about the best electronic based consumer choice

I ever made, excepting that central air/heat unit ;)

Well, I've got some help and programs from various people and managed to get the accelerator working. I think it will be worth the purchase after I've looked at it. Nice machine. I ran X Former on it (8-bit emulator) and it has increased from 29% at the 8 mhz level to 51% at the 16 mhz level. Not bad!

(Still want to know how well X-Former runs on a TT).

Thanks for the help everyone!!

Source record: 78878

I have concluded that I would like my ST to be able to run a 8-bit machine at something very close to true speed.

Currently I have been playing with X-former on a 16 mhz machine. I am impressed that it runs at 51% true speed. And I like the way it allows you to use a 8-bit drive. Has anyone tried this on a TT or Hayes yet and if so, what kind of speed do you get?

How to know? Well, the folks who made the ST XORMER made a little test:

10 for x=1 to 10000:next x

A regular 130 XE could complete that in 22.5 seconds. A 16 mhz ST can complete it in 44 seconds.
So how about the TT, Hayes, or other high end Ataris?

And I was wondering what other emulators are out there? Wasn't there an 8-bit emulator that you could snap in like a cartridge and run software drivers?

I would love to learn the world of 8-bit emulation on the ST, so to quote laugh-in "SOCK IT TO ME!" :)

I guess I should comment on this, since I do have some hard experience
as to what is done and not done by a graphics card when it comes to
the VDI. ;-)

>Oh, well, I'm afraid my screen is not a good example of that right now. :-)
>
>Starting from the back, I have a 960x720 256 colour XIMG of a canal in

Background images are indeed something that would normally have to
be moved to the card by the processor every time an area needs to be
updated. I intend to add a new feature to fVDI that will make it
possible for applications to allocate memory on the graphics card,
though, which will be perfect for this sort of thing.

>Venice which is of course all bitmap. Then I have some sixtyish icons
>of very varying shapes which are also all bitmaps. Then we come to the

It's simple enough to cache icon bitmaps in local RAM on the graphics
card. Currently fVDI (on the Eclipse/RageII) does that whenever it
encounters a 32x32 bitmap that is about to be blitted.
Further blits of the same image will be a _lot_ faster.

It's of course possible to cache bitmaps of any size (like your
background), but it would be a bit more complicated.
I'll probably give it a try in fVDI at some point.

>menu line and windows, Which do contain some surface fills, and line
>drawing, mainly for the frame elements. But appx 80% of the window

A major problem with menus is that the background is normally blitted
to a buffer whenever they drop down and then blitted back again when
the menu is removed. The buffer it is blitted to/from is of course in
RAM, which causes a significant slowdown.

Fortunately, there is a way to get at the address of the AES's
background save buffer and then it's just a matter of redirecting the
blits to local RAM. fVDI (naturally ;-) does this, and it causes a

huge speedup of the menus (and anything else that uses the same
buffer).

Applications that do their own buffering will have to suffer the
consequences. At least until they can use the new fVDI feature that
I mentioned earlier.

>surfaces are text, in various fonts, and that is of course bitmap data

Yes, fonts are bitmaps, but they are only a single bitplane, even when
the screen is in an 8/16/24/32 bit mode. Thus, the time to transfer
them to the screen goes down by that factor.
That is, text will be output at about the same speed as in the normal
monochrome mode in _any_ graphics mode.

Also, fonts are easy to cache in local RAM and then it's just a matter
or telling the card what to blit and where.

>again. So if we are just measuring amounts here, I'd say that a large
>majority of my present screen is bitmap-derived.

But I can assure you that (at least using fVDI), everything but the
background image will still be drawn a lot faster than in the normal
colour graphics modes.

>>And bitmaps are often "re-used" by the card as
...
>That is of course true. The heavy costs are when new data needs to be moved
>onto the card from elsewhere.

As I've described above, there are various ways to keep the amount of
such data down.

>>However, if you write a 3D-game and load the textures to a good 3D-card
>>you get framerates impossible with any CPU. It's just a matter of where
>>you want the data processed.
>
>Again, this is quite true, but here I must doubt that we have such cards,
>with the necessary software support, available for Falcon at this date.

Well, the card that will be supplied with the Eclipse has 3D support.
Unfortunately, it isn't described in the normal documentation, so it's
been impossible to do anything with it. If we're lucky we'll get hold
of the necessary documentation later on.

Perhaps someone would like to dissassemble and analyze the x86
Direct3D drivers? ;-)

>I never disputed that. What I did question was the extreme factor you
>stated for graphics acceleration with cards and software drivers that
>can be installed on a Falcon right now. 160 was a bit steep I think.

A number like that could be correct for window scrolling and things
like that, but in general the speedup is indeed a lot lower.

>Its the reverse here. At least 80% is bitmaps of various kinds.

As I explained above, as long as you don't move windows around (and thus don't need to update the background image), things are not as bad as you make them sound. Far from it.

2751. Re: Demon Fax TIFF reader

Newsgroup: comp.sys.atari.st
Date: 1999-05-12 00:00:00 UTC
From: rich@rjelwell.demon.co.uk
Message-ID: <926539732_OASIS_NEWS@rjelwell.demon.co.uk>
Source record: 78884

For those following this thread here's a quick update.

I have tried have demo, freeware and shareware app I can find on the Net in an attempt to view a TIFF file generated by Demon's Fax service.

Unfortunately it looks like there is no program available for the Atari that can view, or even convert, this type TIFF files.

The current list of tried apps stands at:

Calamus SL demo
Look'n See
GemView
Coma
GrafTool
Hackfax
Junior Office
StarOffice
and there were probably others that I have forgotten.

Thank you all for your help.

Rich.

2752. Re: New STinG (1.20)

Newsgroup: comp.sys.atari.st
Date: 1999-05-12 00:00:00 UTC
From: peter.slegg@zetnet.co.uk
Message-ID: <3739e3e4$0$9534@znews.zetnet.co.uk>
Source record: 78885

I carefully installed Sting 1.2 last week and so far no problems.

All I did was
1. Unpack the archive into another partition.
2. Rename my existing C:\STING folder to C:\STING.115
3. Move the new STING folder to the C:\ drive
4. Copy my own DIAL.SCR and DEFAULT.CFG over the archive ones.
5. Replaced the CPX's and the STING program in the AUTO folder.
6. I re-booted at this stage and tried to active Sting from the
Internals CPX.
7. This didn't work so I extracted the STX files from the folder
C:\STING\STING into C:\STING as they had been in the 1.15
installation. Re-boot again.

(NB. I have always had to put the STING.INF in the C:\ root as it
== has never worked from within the AUTO folder.)

I think that was it. Everthing worked perfectly from that point.
I have noticed a massive improvement in speed, the lack of which
I had always blamed on accessing the web via a modem.

I am using a 33k modem from my Milan and CAB2.7 normally ran at
about 150-300byte/s sometimes reaching 650 and often falling as
low as 50byte/s

Now it runs at 1500-3000 and rarely any lower. That's a TEN times
speed improvement and makes web browsing practical at last. I
wonder if this version of STING is just running better on the
faster machines?

Anyway. For now I am happy. At least until I get used to the
higher speed :-)

Many thanks to those involved in the development of STING and
for their continued support of the Atari platform.

regards,

Peter

Hi

Yep I'm still trying to get the bugger to be seen using HD Driver...

I've managed to get it seen, but only once. If I turn the drive OFF and on again, it will detect it in the ID screen. I can do this as long as I like, but can't get it find it after the first time!

Here is some info, hopefully this may help.

The Drive: Fujitsu M2513A

HD Driver detects this as: FUJITSU M25 13A 2000 Optical Memory

The following switch settings: ID=2

SW1
Parity: disabled
SCAM mode: enabled - it will not be detected at all with this off!!!
Device enquiry: MO
Spindle automatic stop mode: disabled
LED mode: normal

SW2 (these are all the factory default)
Write cache mode: disabled
SCSI type 1: disabled
Mac mode: disabled
Verify mode: verify enabled
SCSI type 0: SCS1
Save data pointer message: enabled
Down load mode: disabled
Factory test (not to be set by user): disabled

I have the following jumpers set:
CNH! (Terminating power and SCSI termination)

1-2 Power supplied by drive: supplied
3-4 Power supplied by host controller: supplied
5-6 SCSI termination: disabled

Totally formatable via ICD utilities although I can't get it to boot, I don't really need it too.

Totally formatable via PC.

The drive is set in the following chain/link and this gives all the above results.

Atari - ICD Link II- MO drive - IBM LPS270 hard drive - terminator
(doesn't make any difference if the terminator is on or off!)

I'd love to know if HD Driver is at fault or whether it doesn't like the
ICD Link II!

Hi Martin,

I'm interested in the stuff you advertised, as I can use it to
move semi-large packages between my systems. At the prices
you mentioned (quoted below) I'm prepared to buy all the stuff
you mentioned (also quoted below) except for the 520 STFM.
(I already have more STs than I use.)

As I figure it that makes for a sum of 46.5 UKP,
but I'll also pay for postage of course.

You'd better check what the postage will come to from your end,
as I live in in Sweden (in a suburban of Stockholm), and these
costs are not always 'symmetrical'.

How do you want payment ?
Cash in letter or what ?

BTW: Which CD-ROM do you mean? There is a little bit confusion about the
"The complete Atari MiNT 1998 CD" and MiNT'98 CD.
The first one holds just a collection of MiNT stuff such as KGMD which is a
(outdated) installation package. The KGMD package is however a good start.
Once you're familiar with MiNT you can easily updated your system.

The second CD is a complete MiNT setup. It does contain an installer.
According to the manual is just a matter of following the instruction but
there has been quite some postings from guys who have had problems to get
it running. Nevertheless it's surely worth the price as once you managed
to get the package working you'll have a very powerful system.

Yes, I'm sure, although I should have said uploads were _roughly_ twice
as fast with 1.51b (1024 CPS compared to 600 CPS for 1.52b).

My Serial 2 was taken over by a video card, so like Louis I'm using
Modem 2 instead (enough headroom for a 28K modem).

Peter,

it seems you've been victim of this newer (in version 1.15) TCP.STX as
well; if you'd moved back to an old one you'd have experienced speeds of
about 3500 earlier...

My Gawd, did you take this speed for "normal", you didn't, did you?????

Don't think this version will run better as in terms of speed increase on
faster machines, this all depends on:
1. modem speed/port settings
2. line quality, errmm, translate that into ISP capacity.

I think a 33k modem would go to 3500cps on a good link. Perhaps faster on
a proxyserver.

Tell you the truth; I would have quit Internetting on a 33k modem with av.
speeds of 150-300 bps real fast... :-)

2760. STinG 1.20 - DNS Cache load failed

Newsgroup: comp.sys.atari.st
Date: 1999-05-12 00:00:00 UTC
From: leaver@alphalink.com.au
Message-ID: <7hd0qt$8jd$1@black.interact.net.au>
Source record: 78893

A small puzzle.

Each time I boot, STinG 1.20 reports failure to load the DNS cache.
STinG seems ot write a new version at each session but is then unable
to load it at the next. I have tried deleting the file to ensure that
a new one is written, but it still can't load.

It doesn't appear to affect operation, although I assume that it is
slowing down resolving.

Maybe the ftpd there is run over tcp wrappers that only allow access to
certain hosts?

Ciao

Thomas

Hi Trevor ... being a double agent (I have both PC and Atari, and have had for a few years, sshh don't tell anyone) some info that might be helpful. The PC market is so absurdly competitive these days (PII for 500 quid anyone?) that there is actually very little difference between manafacturers both of complete systems and of components. Probably the most important issue with a PC is RAM as stinky old Windows runs in it. If a machine has little RAM a RAM upgrade will actually increase performance more than a processor upgrade. So get plenty of RAM (32 megs min I'd say). Reliabilty isn't really an issue as PCs are just very reliable (hardware at least, Windows will regularly play all sorts of games with you but you don't get a choice about that bit) but a 12 month on-site warranty should be expected (if not demanded). If you're happy with the price go for it I'm sure your son will be pleased.

>said, I'm no authority on the internals of 68k CPUs...

Sounds ok to me anyway. In any case, since the things of interest that
we have discussed only relate to BCLK, I think we can forget PCLK, as
being somthing of interest only to the internal timing of the CPU, not
having any impact even on timing as seen by a user or programmer.

----- snip ----- re: graphics blitting needs
>
>Precisely, but if you watch the screen in front of you now you'll probably
>notice that almost everything is generated by the VDI, and not bitmaps
>blitted to the screen.

Oh, well, I'm afraid my screen is not a good example of that right now. :-)

Starting from the back, I have a 960x720 256 colour XIMG of a canal in
Venice which is of course all bitmap. Then I have some sixtyish icons
of very varying shapes which are also all bitmaps. Then we come to the
menu line and windows, Which do contain some surface fills, and line
drawing, mainly for the frame elements. But appx 80% of the window
surfaces are text, in various fonts, and that is of course bitmap data
again. So if we are just measuring amounts here, I'd say that a large
majority of my present screen is bitmap-derived.

>And bitmaps are often "re-used" by the card as
>well, e.g. scrolling or moving windows is very fast on my low-spec'ed Nova
>because the card blits most of it around the screen. No ST-RAM access or
>CPU required at all.

That is of course true. The heavy costs are when new data needs to be moved
onto the card from elsewhere.

>If you're talking about games or demos then the difference is marginal,
>simply because every pixel you see is generated and blitted by the CPU.
>However, if you write a 3D-game and load the textures to a good 3D-card
>you get framerates impossible with any CPU. It's just a matter of where
>you want the data processed.

Again, this is quite true, but here I must doubt that we have such cards,
with the necessary software support, available for Falcon at this date.

>My point is that with the Videl you simply
>can't do this, *everything* must be done by the CPU.

I never disputed that. What I did question was the extreme factor you
stated for graphics acceleration with cards and software drivers that
can be installed on a Falcon right now. 160 was a bit steep I think.

>Btw. how much bandwidth do you have left when the Videl is running in
>16-bit? In 640x480, 60Hz it will use almost 4Mb/s, which eats up quite a
>lot of the original 10Mb/s. I still have 5Mb/s (7Mb/s with a bit of
>hacking) regardless of resolution, I could use 1600x1200x24/120Hz if I had
>a more modern card... Now, imagine the same card on a CT2 with 10Mb/s.

Ok, here are some more nembench excerpts for various resolutions I use:

Test resolution : 640x480x65536_colours 61.0 Hz Interlaced
Linear 32bit read (ST-Ram) -> 7.972 MByte/sec (~150%)
Linear 32bit write (ST-Ram) -> 8.880 MByte/sec (~137%)
Linear 32bit copy (ST-Ram) -> 4.446 MByte/sec (~137%)

Test resolution : 640x480x65536_colours 63.5 Hz Noninterlaced
Linear 32bit read (ST-Ram) -> 5.152 MByte/sec (~96%)
Linear 32bit write (ST-Ram) -> 5.674 MByte/sec (~87%)
Linear 32bit copy (ST-Ram) -> 2.841 MByte/sec (~88%)

Test resolution : 768x576x65536_colours 88.5 Hz Interlaced
Linear 32bit read (ST-Ram) -> 5.116 MByte/sec (~96%)
Linear 32bit write (ST-Ram) -> 5.639 MByte/sec (~87%)
Linear 32bit copy (ST-Ram) -> 2.819 MByte/sec (~87%)

Test resolution : 960x720x256_colours 71.7 Hz Interlaced
Linear 32bit read (ST-Ram) -> 7.123 MByte/sec (~134%)
Linear 32bit write (ST-Ram) -> 7.895 MByte/sec (~122%)
Linear 32bit copy (ST-Ram) -> 3.947 MByte/sec (~122%)

The last one is my normal work resolution, And as you can seem that still
leaves the ST-RAM access noticeably faster than on the max speed resolution
ST High on a normal Falcon (the reference rez of nembench).

That is why I don't really need a graphics card, even though that naturally
is even faster.

----- snip ----- re: split memory for dedicated video usage
>
>But ST-RAM is just DRAM, so higher resolutions/refreshrates/colours means
>slower access for the rest of the system. With VRAM you don't have this
>problem, you always have full speed access to the video-mem regardless of
>how much bandwidth the graphics-card use.

I know. What I meant was that on a falcon without graphics-card, ST-RAM
corresponds to traditional video board RAM, slowed down by scanning,
while FastRAM (if present) corresponds to VRAM, unaffected by Videl.

This means that the most efficient use of the system will be achieved if
ST-RAM is only used for those dedicated things that really require it.
(eg: Screen RAM, DMA buffers, hardware blitter operations.)

---- snip ----- more on my disbelief in the '160 times faster' claim

>
>Ofcourse not, but have a look at your monitor: How much of the visible
>area is generated by simple primitives? I assume more than 80% of my
>screen is covered by these,

Its the reverse here. At least 80% is bitmaps of various kinds.

>and the CPU doesn't have to push more than a few hundred bytes to move a
>window. In such a "real life" situation my graphics-card is somewhere
>between 10 and 20 times faster than the Videl.

That is different. I have no doubt that this is true. It should be.
I only disputed the higher claim you made earlier.

>> a graphics-card. In fact I do not believe it can be much faster at all,
> ^^
>You've admitted that you've never seen a graphics-card in action on a
>Falcon, and I can assure you that you're *very* wrong here ;-) In real
>life, I notice very little difference between my Falcon and my (now sold)
>450MHz CeleronA with a ultra-cheap S3-card... (except that I only have 1Mb
>in my Nova)

Actually my original statement was not wrong, though the 'out of context'
quote above definitely is wrong. My original statement concerned only
the specific operations involved in moving a bitmap into the graphics
card from other memory. Those particular jobs can not be done with the
same comparative speed as internal card operations, since they require
extensive accesses to external memory. This means it will mostly be the
CPU that does the job, although custom-made blitters of the card could
also do it, if they can be adapted to 680x0 bus sharing methods.

>> certainly nowhere near the factor 160.
>
>But again you assume that the CPU has to shift every pixel to the
>videomem. This is simply not the case, unless you play games or use a GUI
>that entirely bypasses the VDI!

Since my original statement concerned bitmap operations, it is certainly
true in the limited context that it was intended for, but I also think
this last part (not near 160) applies to overall performance. To be
honest I think you do too, since you lowered that claim to 10-20 above.
Those numbers seem quite reasonable to me, so we can stop 'bickering' ;-)

I'm glad to hear it. So, are they a network yet, or standalone ?

>> CAB 2.7, on the other hand, has no problems of this kind.
>
> I haven't been able to locate CAB 2.7 nor STinG 1.20 on the Internet.
>Do you have any URLs?

CAB 2.7 is commercial, but I've heard that a pretty good demo is available,
limited so it can't save links to hotlist, but otherwise usable. It should
be available from ASH I guess, who had this URL when I visited them last:

"http://members.aol.com/ashinfo/index.html"

That will be German of course, and I don't know if/where an english one can
be found, but some of the other guys probably can tell you that.

STinG 1.20 was released on a subpage of my homepage, so you can find that
URL in my SIG below.

>
>Centek seems to dislike the 040 a lot, especially before the CT2 was
>released and the AB still was available they published a lot of crap on
>their website.

I'm not going to discuss the truth or falsehood of those statements, as I
have not followed the developments that must have preceded them. So I am
not sure exactly what some of their referents refer to.

My impression from some of the stuff was that some other French distributor
had attempted to market a 68040 accelerator advertising the PCLK speed.
That would indeed motivate most of the stuff posted at Centek.
But I have no sure information about that.

>I can't see any reason why the 030 should be better than
>the 040 speed-wise - run it at 50MHz on a CT2-based design and it will be
>atleast 20% faster when accessing FastRAM, 300% faster cache, 2000% faster

>FPU...

Except that there are some things it won't do at all...
I thought we had already covered this ground.

Yes, the Cache does make a 68040 faster, and the fast conversion logic of
the FPU helps make that faster too. I've never disputed that.
But the CPU has some limitations in compatibility to 68030, while the FPU
requires a software emulator for most of the FPU opcodes of a 68882.

You have to take the good with the bad. In the end each user must decide
for himself what to prioritize, and which solution he then prefers. This
is not the kind of issue where one choice is right and all others wrong.

>> This makes it likely that they will concentrate on 68060 stuff as the next
>> step up from 68030.
>
>For their Phenix - yes, but I can't see that they will make a 060
>Falcon-accelerator.

No, I agree. That would pull the rug out from under their expected Phenix
market. Their angle will instead be that people should upgrade from Falcon
to Phenix, either directly or when they 'outgrow' their 030/040 accelerators.

>You have to login to the server first and then start slip.

A friend of mine needed such a connection a long time ago, when STinG did
not have PPP/PAP yet. He had no real problems. All that was required was
to configure the server machine to allow a scripted login, rather than PAP.
That should be possible on any server that supports SLIP at all, since the
users of SLIP have no way to get past a PAP login.

For a scripted login you will need to use the dialer, and should not have
the serial port marked as active in the saved data of STNGPORT.CPX.

For simple connection of a single machine to a network there is not much
advantage of PPP. In fact the only real advantage is the 'automated' PAP
login and the negotiation of MRU/MTU and NAMESERVER info, AFAIK. Once the
connection is active PPP is actually less effective than SLIP with VJ,
as SLIP has a very low overhead, both in data size and processing time.

That's what I meant too. The DSP itself is run at a full 50 MHz with CT2B,
and only the DMA interface is affected by other speed considerations.

>> all clocked at 50 MHz by CT2B, giving at least a 56% speed improvement
>> in their performance. The improvement will be somewhat higher for the
>
>Btw. for those who wants to speed up their DSP and FPU permanently, have a
>look at http://atari.nvg.org (in the hardware-section).

Ok, I'll check it out too, though for me this is not really relevant as the
CT2B acceleration of these chips is permanent enough for me.

----- snip ----- re: 68040 criticism on various web pages
>
>Well it says something like "...having their caches turned off 90% of the
>time to be somewhat compatible". Pure c**p (again, sorry kellis, but it
>really is!). Never mind.

'Turned off' would be silly, except when trying to run an old game through
a compatibility emulator. At least the 'write-through' mode should be kept
active for normal usage. I'm doubtful about other modes though, as it is
the 'write-through' mode which corresponds to the 68030 mode that Falcon
and its system software was designed for.

>> some time ago. Actually I can't remember what she said about other CPU's
>> than 68030, since I was most interested in facts that concern CT2.
>
>Ditto. I just got a bit upset about the AB-reference :-)

I can understand that. I myself prefer if derogatory references to other
equipment is not included in normal text discussing matters of this kind.
Comparisons between competing equipment should only be made as a serious
attempt to find out. or clarify to others, the technical merits of each,
and their disadvantages too of course. But never in a derogatory form.

It is wrong (though natural ;-) to get caught up in emotional entanglements
with a piece of hardware, and so get emotionally upset about competing stuff.

----- snip ----- re: 68040 compatibility problems
>
>I guess I'm just lucky, because I don't have any problems with this. I'm
>using fairly new apps though.

That helps of course, as APPs that totally ignore the rules are no longer
being taken seriously in our market. And since you have already stated that
you don't play games on your computer, that eliminates another major source
of problems. Nevertheless, many other people do have problems of this kind.

----- snip ----- re: designing an add-on through-port for CT2B
>
>This is ofcourse an option, but it would definitely be easier, cheaper and
>safer to just have those connectors on the card itself...

I agree completely. That is what I too would prefer.
If that would raise the price of a CT2B by a few euros, so what ?
I wouldn't have dropped it from my shopping list just for that,
nor would anyone else have, I think.

----- snip ----- re: conflicting nembench files
>
>Something must be seriously wrong here, the write-performance is pathetic!
>Even with copyback-cache disabled my AB performs much better.

Well, I only passed the file excerpt to you. I had no hand in making the
tests, so I don't know anything about what special settings were active.

>> in the write to FastRAM. Somehow you seem to be having write caching
>> at a higher efficiency than read caching, which should not be possible.
>
>According to the CT2-test in AC#12 the CT2 also was faster at writing than
>reading.

Writing to RAM is faster than reading, because Centek have managed to shave
off a cycle as there is no need to wait for RAM data to stabilize on the bus.

Writing to cache is different. The cache checks themselves are identical,
but for changed data the write must also change RAM. That is why caching
faster for write than for read should be impossible with Falcon compatible
caching. But the loss for such writes should not be too large, if write
cycles are reasonably efficient.

>> I don't understand that. But then, I don't understand the ridiculously
>> bad write caching results of the file I had either...
>
>It must be a cache-problem, perhaps a poorly configured driver.

That is possible.

>> I agree with most of that. Except that I must add that it is clear that
>> CT2B is faster for all kinds of write operations, both to FastRAM and to
>> ST-RAM and to other hardware.
>
>To ST-RAM, yes, but the diffence in fastRAM is very marginal.

Sure, but it is there. So in that respect the AB is not faster.
That was all I wanted to say about it. Just clarifying the facts.

>Consider the fact that the CT2 runs at 50MHz while the AB only runs at
>32MHz you see that the 040 is a lot more efficient.

Well, it does have extremely fast caching modes, and other advantages,
but the lack of efficient bus sizing works against them too. As for
maximizing RAM access efficiency, that is another matter entirely.

CT2B could make faster RAM accesses, but that would raise the requirements
for RAM access speed to levels that normal EDO SIMMs simply can't reach.
The wait states are not present because the CT2B needs them. It doesn't,
but the RAM itself does. That is why accelerators at different speeds do
not show proportional differencies in their RAM access.

----- snip ----- re: caching modes versus DMA RAM integrity
>
>It's very easy: Don't cache the DMA-buffer :-) I use copyback-cache all
>the time, both with TOS, MiNT and MagiC and it's generally very stable.

What you say requires that each program which sets up any RAM block for use
with DMA must also reprogram the PMMU tables to set cache inhibit bits for
this block according to 68040, not 68030, PMMU methods.

I don't think that any program not written specially for 68040 will do this.
It has never been a GEMDOS rule that any special consideration need apply for
DMA blocks, except that they should reside in ST-RAM and should not use PMMU
remapping for other logical addresses. The caching was never an issue, except
that it might be wise to flush the read cache after a DMA read operation.
But I think many programs even skip that, especially those written for STs.

----- snip ----- re: every board should have a through-port
>
>You are right (you don't hear me say that often...).

Nice to know that you haven't lost the ability to do so ;-)

----- snip ----- re: Videl acceleration with CT2B
>
>I don't doubt that, but what I meant with "hardware acceleration" is that
>the Videl has no hardware that can process and render primitives, and this
>is one of the major advantages of a dedicated graphics-card.

It certainly is, but it is also a fact that the Falcon blitter could do
lots of things that no one has bothered to use it for. That could not
outdo a graphics board, of course, but it might still be a help to those
who don't have one.

>> It is not a matter of speed, but of physical addressing schemes that

>> that causes part of the logical address space to not comply as well.
>> ($00xxxxxx is not made fully equivalent to $FFxxxxxx)
>> Those are serious compatibility issues.
>

>This is basically how the AB is implemented as well, the PMMU is used to
>create a continuous fast-mem in the standard TT location.

I assumed as much, from various clues, but I'm glad you confirmed this.
IMHO, that is a very bad method, as it locks the PMMU to using a special
non-straight mapping, contrary to traditional Atari TT memory maps.

There are other (quite simple) methods that solve the problem better.

----- snip ----- re: mixing PMMU usage for different purposes
>
>> No they don't, because they can't. It is not possible to impose one
>> complex PMMU mapping system on top of another. It doesn't work that way.
>
>Well, MiNT does that and it works. It will not work if the previous tree
>was dynamic, but so far they're not.

For each specific PMMU mapping used the methods of adapting to it must be
different. There is no generic way of knowing which bits are safe to
modify and which are not, without intimate knowledge of the other mapping
software and how alterations will affect it.

MiNT may work with lots of things, but IMHO that is very much due to the
fact that most people run it as MINTNP.PRG, and not as MINT.PRG.

----- snip ----- re: memory protection and virtual memory
>
>Memory-protection and Outside can't live together for one simple reason:
>Both are dynamic.

Sure they are. But that is not the only problem.

>But there's no problem in inheriting a static tree and
>use that when building PMMU-trees for individual processes (like MiNT
>does).

There can still be problems, such as conflicting page sizes, and some
overlapping ranges, or subtrees used for multiple ranges etc.

>> That is why the basic machine must be independent of PMMU in mapping
>> physical devices and RAM to addresses that comply with Atari specs.
>
>That's preferable, but not always possible.

For finished designs that do not already allow it, it is indeed impossible.
But with CT2B I don't think we need to be in that corner yet. Its decoding
logic is in-situ-programmable, so it can be reprogrammed at any time. So
the design is not locked in 'finished' state as long as any support exists.

That will require sending it back to Centek, for them to do it, and so they
might want some small fee to cover their costs, but I'd pay that gladly to
get rid of this incompatibility.

----- snip ----- re: more on avoiding PMMU dependency in accelerator boot
>
>If everybody wrote clean programs instead of depending on the memory-model
>of one particular computer (the TT) there would be no need to use the PMMU
>for this. Nowhere does it say that alt-RAM begins at this and this adress,
>in fact you can add chunks of alt-RAM at will.

So it can, and I use that in a utility program I made for my CT2B, so as to enable FastRAM access without getting the really weird PMMU mapping. But it still won't work with 'Outside' of course, but fortunately I don't really need 'Outside' with the RAM amount I now have.

But my main objection was not the fact that FastRAM starts at another address, but the fact that its physical address does not coincide with logical address used when it is active. That constitutes a specific danger in itself, as it means that any program resident in FastRAM will cause random crashing if it attempts to clear or reprogram the PMMU mapping, such as a TOS relocated to FastRAM will do (just as one example).

Also, there is no _need_ to do it via PMMU in any case, as there are other ways of hiding the RAM for compatibility boot modes that need the TOS not to attempt using FastRAM. If such means are used, then the FastRAM, when 'visible' at all, can reside at base address $01000000 both in the physical and in the logical mapping, which eliminates all such problems.

Finally, you seemed to miss another major compatibility issue, which is that $00xxxxxx and $FFxxxxxx should be treated as one and the same block. Not just mapped similarly, but identically, sharing the same PMMU subtable (when PMMU mapping is used) even if mapped identically at hardware level (which preferably should be the case).

Otherwise they will not use the same ATC entries, which can lead to caching inconsistencies.

>(Btw. if there are any parts of your message I haven't commented it's
>simply because you're right and I'm wrong and I *hate* admitting it...)
>
Nice technique that ;-)

>right to my ISP. Neither did 1.51b. I have to hit reload everytime it
>first connects. Went back to 1.5b again.

Yes, there appears to be some problem with early data when reading first dir.
With Internet servers the problem seems inconsistent, but not on local ones,
where it happens very consistently (every time AFAIK).

This should not be a TCP problem though, because then it would strike all
transfers which it doesn't. So it appears to be some problem with how aFTP
parses the data at start of the first dir opened on a server, as I never
have any such problem on successive dirs.

The problem is clearly visible with a local server, where it causes the
first file/folder in the first directory opened to appear missing.
Alt-R has fixed that for me every time, so I don't think this is any
bug of the kind that makes it necessary to go back to older versions.

But users have to decide that for themselves of course.
For myself, I choose to stick with 1.52b for now, mainly because it
gives me the fastest FTP transfers I've had with any aFTP version.

> FPU...

I don't think its a case of dislike...it to me is more likely to be a
case of availability of the 68040. I guess the 68030 and 68882 chips
they use could be removed from older Macs, whereas the 68040 Macs are
still a quite nippy machine. If 68040 based owners of Macs are not
selling their machines, we do not have many 68040 chips to use in the
accelerators...

Source record: 78938

WOW - those Swedish sites are different!!

Sorry, Ronald, but going to your site and the ASH site doesn't help me find STinG 1.20 or CAB 2.7...the pages are so scrambled, I can't make out where anything is. I'm using my Lynx account as the download is much faster and I don't have any client software like FTP or Telnet working for STing 1.15 yet.

Each page loads with all the text jumbled on top of each other; each succeeding page is added onto the preceding one without a screen refresh. Refreshing the screen manually just gives the current page but it's still so scrambled, I can't make out what's going on.

The page scrolls in different areas so as soon as the page loads, certain paragraphs start immediately scrolling up the scrren while other paragraphs and sentences stay where they're at, so all I am left is a mad scramble of letters, non of which is legible. Manually refreshing the screen doesn't help.

I've noticed this happens with a lot of European sites (mostly Swedish and German) so the Internet standards there must be quite different than North American standards as the pages are definitely incompatible.

Is there a North American mirror where I could find these programs?

Thanks, Tony

It's odd that your CT2 is running much hotter than others?

>I really hate this, because it means I must blow dust straight onto the
>CT2B, and it is beginning to look a bit 'hairy'. But it's the only way

Yes. It's supposed to be best to suck the heat out IYSWIM, but sometimes the physical mounting of the fan precludes this (and it's not possible to run the fan in reverse).

>I've found that works here. I really must get me a tower soon, so I can
>arrange better cooling for the whole machine.

Is natural cooling enough if you leave the top cover off?

>I'd like to keep the original case to, but not as the cooling works now.
>I guess I could try mounting a heatsink on the ispLSI chips too, perhaps
>even with a fan of its own. That just might work.

Tricky one as you'd have to stick it on - hard to remove without signs should there be a hardware update requiring a swop-out...

Yes, that's right - I should have remembered that it wouldn't be capable of
emulating any of the Falcon's subsystems. What if the program had been
compliled with the 68030 flag set? (I'm thinking of the 030 version of
Semper (the FTN mailer) and the 030 version of Ghostscript, neither of which
use DSP etc AFAIK).

>Can anyone help me how my Falcon030 can recognize and install the Iomega
>zip SCSI drive ?
>It is connected after an external Micropolis 1GB harddisk.
>How can someone install a new device like this ?
>Thanks for any help

Normally it's dead easy. Just hook the Zip on your Harddisk (make sure the HD isn't terminated) and terminate the Zip. Make sure the Zip and your HD hasn't the same SCSI ID.
I don't know how the recent Zips looks like but mine has two little buttoms just between the two SCSI ports. One for the termination and one to set the SCSI ID (5 or 6)
My experience is that these buttoms are very vulnerable so I use these buttoms as little as possible.
If possible you'd better connect your Zip to your Falcon and your HD to the HD. Ofcourse this will require some extra SCSI-cables but IMHO it's the best solution.

Once connected and properly set run your Harddisk util for instance HDdriver and make the proper settings like switch on the SCSI-ID for the Zip in "device configuration".
Reboot your system and if nothing went wrong you'll see that the system recognise the Zip at boot time.
Next thing you must do (in the most cases) is to install a HD icon on your desktop.
With Thing, go to the "extra menu" and activate "mount devices" and you'll get a new drive icon. Not forget to save the desktop ofcourse
With the TOS desktop it's I believe "Install devices".

Oke this is the first one then. As said it holds the complete MiNT stuff
including the install package KGMD, unfortunately not the English
installation docs KEMD. You can find the English docs however on the
homepage of Katherine Ellis. http://users.southeast.net/~kellis/
You can find more URL's which hold MiNT stuff on my UTSI pages. Just
follow the MiNT link. For the URL of the UTSI see my signature.

It also holds a MiNT cursus (HTML pages) but again only in German. Finally
the CD holds a copy of Cab 1.5 and 2.0 demo.

Some stuff is outdated but usuable. More recent stuff are on:
ftp.funet.fi/pub/atari/piwo-mint
ftp.uni-giessen.de/pub/atari/mint

The MFP you mean ?
That's a lot more than a serial port, though it does contain "Modem 1".

I did a similar repair job once by carefully cutting into the top edge
of an IC, so as to expose the metal just inside the break. That was on
the SCSI DMA chip of my TT (big PLCC IC package).

That is no longer a problem for serious software though, since word started
going around from Atari even before the Falcon release, that selfmodifying
code simply was not to be tolerated. Ok, so some people didn't listen to
it, but serious programmers did, and by now it's an established standard.

>As you point out, the only problem is caching memory that can be altered

Actually it could have been done with perfect safety by extra equations
in the decoding chips, controlling the snoop lines when detecting access
to ST-RAM areas by external bus masters. That would make those accesses
update the cache properly without any slowdown effects at all for the CPU.

>> Alternate RAM does not, but TT-RAM does have to be based at $01000000.

>reasons for that, unless you use some software that bypass Malloc() and
>goes directly to the hardware.

As 'Alternate' RAM has become more common nowdays it is not so much of an
issue I suppose, but the TOS can't boot Alt-RAM without external commands.
This means it has to be done by some \AUTO\ program or similar means.

>> Alternate RAM can reside in several blocks, but this unavoidably lowers

Some, yes, but not too bad, though it depends on the design of course.

>> You seem to have missed one of my main points:
>
>Quite likely. I had the impression that you generally didn't like the idea
>to use the PMMU for these purposes.

Correct, I'd like it to be completely free, but some ways of using it are
less important, as they still maintain straight mapping.

>My point was that since the PMMU already is in use, you might as well use
>it to set up a single block of TT-RAM.

Except that it makes any remapping by other programs very tricky.

>But I do agree with you, relocating fastRAM the way you described
>it isn't necessary.

Right, but unfortunately the accelerator designers didn't go for this
method. (yet :-)

>> All of those effects are impossible if physical and logical mapping

>> requires that hardware maps the fastram into a contiguous block, with
> ^^^
>Would be nice, but how easy is it to do this with the countless
>RAM-configurations you can get with multiple SIMM-slots and SIMM-sizes
>between 1 and 128Mb?

Modern decoding logic is programmable, like a 'super-GAL' with lots of
internal 'macrocells', each of which represents a boolean equation of
a very large number of possible inputs.

It is quite easy to set up some of these as data latches, and use some
as a hardware 'adder' for the top bits of the address bus. By placing
a suitable offset code in the latches, the base of the second RAM block
can be adjusted to coincide with the end of the first block. This can
be done by a boot ROM, such as the Flash ROM of the CT2B, though I have
no idea what equivalent of this may be present on other accelerators.

The only problem is to find room in the decoding logic chips for all the
equations you need, for differing purposes, but if the needs are well
considered in the design phase that problem can be minimized.

>> base at $01000000 for TT-RAM compatibility, or at some higher address
>> for simple Alt-RAM compatibility.
>
>Again, I can't see why TT-RAM compatibility is necessary at all.

It is the only way to make a booting TOS start using TT-RAM from scratch.
I believe that this also applies to having MagiC boot into TT-RAM.
Judging from the MAGXBOOT code it does not recognize Alt-RAM for this.

In a way that is correct, if we regard it as a point of TOS compatibility.

----- snip ----- re: MiNT adaptions for accelerator PMMU maps
>>
>> But it only does so by having to include code written especially for
>> that purpose. Of course that can be done, but it is a wasteful way
>
>No, it does not contain code specifically for the AB- or
>Milan-configurations.

The code was written specifically to gain compatibility to accelerators.
How much more specific can you get ?

Since both AB and Milan were out there, they naturally aimed for some
solution that would fix it for both. But there is no guarantee at all
that this also fixes it for any newer accelerator not yet released.

I still think that this had been better fixed in the accelerator designs.
Then it would have been fixed for _all_ software, and not just for MiNT.

----- snip ----- re: using ACC to configure PMMU map (Sane ?)
>>
>> That does sound like an unusually inappropriate method to configure
>> system hardware. Still, if the Hades designers had followed some

>> hardware level, then it too should have had no problems with MiNT.
>
>IMO it makes sense to develop the OS to work on new hardware. After all,
>this is the whole point of having an OS in the first place...

To 'work on' is one thing, 'compensate for shortcomings of' is another.
IMHO it is the latter that applies to some of the design choices made.

>> But this only makes the FastRAM accessible as Alt-RAM, not as TT-RAM,
>> so there are still some TT-RAM programs that don't work.
>
>Which ones?

Like I said above, Atari TOS itself (all modern versions), as well as the
MagiC boot routines, favor TT-RAM over Alt-RAM. Via them this also has
an effect on most other stuff (eg: MiNT).

As for other programs, I am unsure about OUTSIDE, as I still have not
managed to boot it with FastRAM on my Falcon. There is also some other
stuff, including game adaptors, memory test programs, and probably a
lot that I myself haven't seen, as I never tried to seek them out.

>Not sure if this helps any - is the resolver expecting a bigger cache?

I haven't made any such change, and 64 is a mighty big number for such
things. That should not normally be exceeded in a single session. But
I do use 100 myself (for no special reason) since a long time back.

I'll have to look over the code again to find the reason for such a
dependency, but in the meantime I suppose it would be a good idea
for David too to try your method. It should not harm anything, and
it might help, since you say it did so for you.

2785. CT2B add-on through-port

Newsgroup: comp.sys.atari.st
Date: 1999-05-13 00:00:00 UTC
From: dlanor@oden.se
Message-ID: <373b2bf81dd0ca6@oden.se>
Source record: 78751

Hi everyone,

Centek have just mailed out a response to the Titan/Core statement that CT2B might be incapable of using a through-port for the expansion bus.

The response was fairly long, and rather 'angry' in its tone, but it did contain some new and vital information for CT2B owners. It describes an add-on through port, very similar to the design which I suggested in a recent discussion here. In fact Centek have already built it, and have used it in successful tests with some graphics cards.
(So much for Titan/Core veracity.)

I suppose it is now just a matter of time until they make them available to CT2B owners. So through-port lack will not limit expandability.

Another mail from Centek also mentions that they are now planning for the next CT2 production series. This will be identical to the CT2B, but will be renamed simply to "CT2" without any letter at the end. The reason for the new production is that the old series is already sold out !
(Non-french retailers might still have some in stock though, I don't know.)

Correct. I remember some demo-coders that would *never* "downgrade" to a
CPU that you couldn't even run self-modifying code on...

>>Why is it so important to the TT-RAM compatible? I can't see any good

But the only TOS that automatically detects TT-RAM is TOS 3.0x, so it
really doesn't matter on Falcon-accelerators.

>>Again, I can't see why TT-RAM compatibility is necessary at all.

This is braindead behaviour for a modern program...

> I still think that this had been better fixed in the accelerator designs.
> Then it would have been fixed for _all_ software, and not just for MiNT.

But this means that you would have to introduce the split memory-model in
both the Hades and Milan, I don't think the designers did it they way they
did because they're stupid?!?

>>IMO it makes sense to develop the OS to work on new hardware. After all,

If the same logic applies to hardware, then the Falcon should have been
redesigned instead of just adding accelerators to it...

Asking price is: $500.00 (Selling as a package.)

Shipping charges associated with the purchase will be the
responsibility of the buyer.

If interested, send offers to: l.budnick@worldnet.att.net

Hardware:

TT030 with 4 Mb ST and 16 Mb TT Memory
Includes:
Atari Mouse
CyRel hi-rez graphics card - installed
Quantum 700 Kb Internal Hard Drive
TOS 3.06

Migraph Scanner (Wand & Hand Scanner included)

Other Hard Drive Mechanisms (External Drive Case Available)
1 Quantum 105 Mb mechanism
1 Maxtor 380 Mb mechanism

There is no monitor included with the above system.

Software: (Most w/manuals and original boxes.)

CodeHead Software:
Utilities
MultiDesk
G+Plus
HotWire
MaxiFile III
Lookit & Popit
Codekeys

Productivity Applications:
STyle Image Manipulator - Zocra Tech.

When my Falcon boots up in TOS mode the cpu cache is always disabled for some unknown reason. But when I boot up in MagiC mode it's enabled!

All I do to check this is via the System Info cpx.. I will check the box and save the config, but upon rebooting under TOS it's disabled again!

Any ideas?

Also, I've got a zip drive connected to the Falcon which I mostly use to transfer files to and from the iMac. Anyway, I can use the Zip drive under MagiC, but not under TOS. Double clicking the icon in TOS does nothing! (install devices from the menu will remove my Zip icon..)

Any ideas?

Thanks :-}

>no effect in user state.
>This problem can causes bugs...

I am aware of this effect too. It is due to the fact that CT2B hardware
does not generate bus error for this case. Instead Centek rely on fixing
such things via PMMU, but this is not done in TOS 4.x mode or compatibility
mode, since those use the same PMMU map as a standard falcon.

Another similar problem is that no bus error signal is generated by CT2B
hardware when a write access is made to the TOS ROM area.

>A patch in auto folder exist (use PMMU).
>Do you know an URL or an e-mail, thanks ?

I have not bothered to make a patch for the 'super' stuff, as that does
require using a PMMU map of different format than the one normal for the
TOS 4.x mode. (It needs 64-bit page descriptors rather than 32-bit.)

I do know how to do it though, and may do so later. Why do you need it ?
Or rather, what programs do you know that cause problems without it ?

As mentioned in an earlier post, I do have a patch for the 'write protect'
bit for TOS ROM access, if anyone needs it. AFAIK it is only needed for
compatibility to the GEMRAM program by Martin Osieka. I myself always use
this when running singleTOS (which I seldom do, however).

>
>Yes, it is strict vt100. Most European sites go this way - North American
>sites don't seem to have that problem so this is why I thought there was
>some compatibility problems with PAL and NTSC coding.

Ah, well. I don't know quite how to say this Tony, but that's impossible.

(Lecture mode on :-)

PAL and NTSC are european and american standards for how to modulate the
colour television signals onto a high frequency carrier wave. The terms
are sometimes also used (incorrectly) to describe video signals that have
the same timing as for those television standards, and even for monitors
that use such signals. That is the full extent of those terms' meaning.

They have nothing at all to do with Internet protocols, or HTML web pages.

HTML is simply a special text format, that allows multi-page text to be
structured in various ways, including crossreferences to other texts.
(Those are the 'links' of course.) This format is fully international.
There are no national dependencies in it whatsoever, except that some
foreign nations will use different character sets. This is not the case
on my pages, however, as I stick to the english language for everything.

(Lecture mode off :-)

>I'm using Lynx 2.7.
>I can see the frames as links and the other links as well - but when I
>click on them, they go to an identical page so it's like an endless
>spiral.

Well, another guy has just reported that he can access my pages without
any problems, using Lynx just like you, so there is some problem at your
end. I only see four possibilities:

1: Your terminal program is still not set properly to VT100/ANSI
2: Your terminal program is garbage. (it happens I'm afraid)
3: Your ISP's Lynx is not configured properly for VT100/ANSI mode
4: Your ISP's Lynx is garbage. (shouldn't be, but can happen)

But you did say that you got the files from another page, so I suggest
that you drop Lynx like a hot potato and start using CAB instead. :-)
With that you won't need Lynx any more.

----- snip ----- re: caching forbids selfmodifying code
>
>Correct. I remember some demo-coders that would *never* "downgrade" to a
>CPU that you couldn't even run self-modifying code on...

Silly attitude on their part. But in fact it is perfectly safe to use
selfmodifying code even on a 68030 or 68040, as long as it is done in
a specific manner. (Which they did not bother with.)

The only reason for problems is that modification by data access does not
update the instruction cache. This means that parts of a program that
have not yet been inside that cache may be modified in perfect safety, as
long as the caching mode is 'write-through', so that all changes are moved
to RAM. When later that code is to be executed it will be read into the
instruction cache in the already self-modified form. No problems !

In fact some serious programs do use this form of selfmodification so as
to optimize the addressing of some resources that are not determinable at
assembly time (eg: base address of VDI variables AKA line_a variables).
This allows programs to use short and efficient addressing modes to access
many things that are not knowable at assembly time, by using this kind of
selfmodification at startup. The code and tables used for this do not
even have to stay resident, even when the program does, so it is a way to
optimize both speed and space, at cost of slightly slower booting.

One program which does use this technique is NVDI, and that method is one
of the 'secrets' behind the speed it achieves compared to competitors.

It is only if further modifications are needed after the code has been
read into instruction cache that special considerations apply. Even then
there are safe methods of doing it, but these are more complex, and will
defeat the purpose of selfmodification, which is usually done to optimize
speed. Mostly the caching gives better speed improvement anyway, so in
those cases there is no motivation for using selfmodified code.

----- snip ----- re: TT-RAM compatibility as seen by TOS at boot
>
>But the only TOS that automatically detects TT-RAM is TOS 3.0x, so it
>really doesn't matter on Falcon-accelerators.

No, that is wrong. Falcon TOS also detects TT-RAM, but if an unpatched
Falcon TOS does find TT-RAM it will bomb, because the TOS will attempt

to use blitter in that RAM area as well, not realizing that the hardware registers only use 24-bit address pointers.

That is one reason why the CT2 TOS 7.x boot mode with FastRAM is so complex, and the main motivation why the address of FastRAM was not made equal to the standard TT-RAM address to begin with. But there are better solutions.

>> It is the only way to make a booting TOS start using TT-RAM from scratch.

I do not see what you mean by that statement. Stupidity has nothing to do with the matter. If they want to make a computer with a continuous RAM area, not split in any way (as by having IO ports at $00Fxxxxx) that is up to them, but it will not be Atari compatible. All Atari compatibles that want more than 14 MB RAM _must_ use a split RAM model. That is because Atari have defined the ranges $00xxxxxx and $FFxxxxxx as identical, and this has made its way into lots of programming libs and documentation.

Trying to 'undefine' that standard now can only lead to incompatibilities, and to be honest, the software base for Ataris is not so large that we can afford this.

>redesigned instead of just adding accelerators to it...

Sure, just as various models of ST's were redesigned in succession, except that Atari dropped computer support in favor of video gaming, as a result of which the company (as we knew it) no longer exists. But if they had continued with the Falcon, yes, they would have redesigned it. And most likely along the lines of the TT, with full upwards compatibility to that machine. It would have been the only logical thing for them to do.

Im raw boot state, the cache is off for compatibility reasons.
Very few floppy based programs using a floppy boot sector to start are
capable of running with cache active. Most of them would simply bomb.

So it takes some program, preferably used early in the boot sequence,
to activate your cache when you do want it active, as it normally should
be for efficient use of the system.

>All I do to check this is via the System Info cpx.. I will check the box
>and save the config, but upon rebooting under TOS it's disabled again!
>
>Any ideas?

If you use a boot selector such as XBOOT or STOOP, then they are able to
activate the cache for you.

It is also possible for other programs to interfere with the cache setting
of course, so you may have to purge those out to make sure that you, and
not they, have control over the cache. (eg: weird CPXs or ACCs)

>Also, I've got a zip drive connected to the Falcon which I mostly use to

>nothing! (install devices from the menu will remove my Zip icon..)
>
>Any ideas?

I know next to nothing about Macs, but my guess is that the file system
used on the ZIP partition is not compatible to TOS and/or your harddisk
driver. But since you say it does work under MagiC, I guess it is not
a problem with the driver but with TOS itself. It may be possible to
fix it by installing additional driver software, but others can advice
you better on what you need for this.

I had DNS_CACHE = 64, which I think is value in the example
DEFAULT.CFG

>2: In DEFAULT.CFG you need to have "DNS_SAVE = TRUE"
> this enables saving of cached addresses to the file.

I have this. Again I think it comes straight from the example file.

>3: In DEFAULT.CFG you need to have "ALLOCMEM=100000"

And I have exactly that.

I have tried Dave Murphy's solution. It proved to be a once-only fix.
That is, I had been connected with DNS_CACHE = 64. I disconnected and
edited DEFAULT.CFG to DNS_CACHE = 128 and rebooted. STinG found the
cache file. I connected, did a bit of surfing, disconnected and
rebooted. Cache loading failed again.

A problem with the size of the file being written and read perhaps??

Hello Martin-Eric,

qf> This won't work.
Maybe this is just depending on the version of MiNT.

The "original MultiTOS MiNT" works within emulation and therefore maybe
with
STonX too, at least FreeMiNT don't.

Maybe the FreeMiNT programmers want to hold their community together with
the
need of Atari hardware? :->

Hallo Ronald!

RA>It is a problem with Gemini. I've seen it happen with other drives
RA>too, and there is a warning in the Gemini faq that activating lower
RA>case filenames may cause problems.

Well, that might be a problem if that switch is set. But it isn't, and thus I
can see the Filenames as they are, lower case or upper case or mixed, whatever.
This was _not_ the problem, but Kobold created a lowercase filename on a FAT
drive where only *uppercase* filenames are legal.

RA>(Sorry, I only have it in German)

Well, as I'm a German, that doesn't matter ;-)

RA>As Gemini is no longer actively developed, I suggest that Ekkehard
RA>switch to Gemini's closest 'active' relative, Thing, instead.

I have it here and installed, but will not switch over to it because installing
lots of icons and stuff is too much work to do.
In general, I do not encounter any major problems with Gemini. Well, there are
some minor limitiatons, but I can live with these.

I've had this happen to a trusty ST4 - the problem was an old worn out PSU.
If you can't repair yours or pick up a secondhand replacement opt for one of
the uprated new PSUs as supplied by Best Electronics.

Hi Steve,

SS>The Drive: Fujitsu M2513A
the same as mine

SS>HD Driver detects this as: FUJITSU M25 13A 2000 Optical Memory
for me it's 1300 (firmware)

SS>The following switch settings: ID=2
That doesn't matter. If, of course there is no second device with ID 2!

SS>Parity: disabled
Yes. But you shoud take care. I was told that all SCSI devices connected to an Atari computer should have the same parity status, thus: all enabled or all disabled.

SS>SCAM mode: enabled - it will not be detected at all with this off!!!
the mine is disabled.

SS>Device enquiry: MO
it doesn't matter on ST/TT, only PCs are too silly to see the difference between a hard disk a MO drive. :-)

SS>Spindle automatic stop mode: disabled
don't know, but I think it's as you did.

SS>LED mode: normal
the same.

SS>Write cache mode: disabled
Yes.

SS>SCSI type 1: disabled
I think, I changed to "enabled" for I've got SCSI-1 devices only. But that should not be the bad guy.

SS>Mac mode: disabled
Of course.

SS>Verify mode: verify enabled
Yes.

SS>SCSI type 0: SCS1
don't know.

SS>Save data pointer message: enabled Down load mode: disabled Factory
SS>test (not to be set by user): disabled
There, I didn't change the factory settings.

SS>1-2 Power supplied by drive: supplied 3-4 Power supplied by host
SS>controller: supplied
Ah, does your host adapter really provide term power? For normally it does not! Atari saved few pennies when producing e.g. TTs...

SS>5-6 SCSI termination: disabled
That depends on xyour individual insatllation! Your chain _must_ be terminated correctly, that is the very first _and_ the very last device, and none else!

Furthermore, one (or more) device(s) must provide term power.

SS>I'd love to know if HD Driver is at fault or whether it doesn't like
SS>the ICD Link II!
The MO drive was _the_ reason for me two years ago to buy HDDRIVER, because it was the only one (of two or three) hard disk driver soft that could handle with 2048 bytes per sector.

Maybe the Link II doesn't provide term power. Is it terminated?

You know, maybe your chain worked well although it was not correctly terminated.

I have been running my MO since two years, and it's running all the time as temp disk. Its main use is for backup purposes.

So, as your drive seems to be intact, I think there's no reason at all why it should not work with a ST.

Regards, Peter

That is not at all certain. The XFS does not actually _do_ anything at first,
except register itself to the MagiC kernel. All real activity comes later,
and BNet isn't fully operational until BNet.APP (or BNet.ACC) has started.

>RA>Have you tried Videl Inside instead of Screenblaster ?
>
>No, I haven't. Screenblaster uses an external (and programmable) clock source

You'll never know that if you don't try it.

VI does allow the user to set which frequencies are active for each of the
three possible pixel clock sources, so it should fit any hardware. I would
give it a try if I were you.

That's up to you of course, but I use it myself instead of CentScreen, the
screen enhancer intended for my accelerator, because VI is more flexible in
its ability to handle weird resolutions. I can't get the same in CentScreen.

>RA>I think you may have to experiment a bit with \AUTO\ boot order and

That has not been the experience of any other user that I know of, so in
general that is certainly not the case. Some have complained about BNet not
being as efficient and fast as they want, and some have failed to configure
it correctly, but I never heard of stability problems due to its presence.

There is probably some other cause for this problem, which apparently is
'triggered' by the presence of BNet. That is why I suggested checking
with different \AUTO\ and ACC setups.

That depends on what you mean. STinG itself is a fully networking TCP/IP stack, so that is the software natural for you to handle your LAN, since you have just installed it. It will allow you to use any of the serial ports of your machines for networking, and the most common choice for Falcon owners is to use the Midi ports, so Modem 2 is free for a Modem.

If you mean software to handle the installation, the answer is no. It is done by using the CPXs of the sting distribution and then editing some text files.

>STing 1.15 yet.

My page does use frames, but has also been tested with frameless browser
(CAB 1.5) and graphics turned off. This works fine. What you get in
a frameless browser is primarily a simple menu line. A click on the
'STinG' item in this menu switches to another similar menu line.
A click on the 'File' item in that menu brings up my page for STinG
download archives, including STinG 1.20 .

>Each page loads with all the text jumbled on top of each other; each
>succeeding page is added onto the preceding one without a screen refresh.
>Refreshing the screen manually just gives the current page but it's still
>so scrambled, I can't make out what's going on.

Your Lynx must be seriously misconfigured, or else you have entered the
ISP shell with a terminal program that can't deal properly with VT100
terminal control codes. These are used to reposition the cursor so as
to build up an entire page in a more efficient manner.

Check the settings of your terminal program to ensure that you have full
VT-100/ANSI support active, then try again. It should work.

>The page scrolls in different areas so as soon as the page loads, certain
>paragraphs start immediately scrolling up the scrren while other
>paragraphs and sentences stay where they're at, so all I am left is a mad
>scramble of letters, non of which is legible. Manually refreshing the
>screen doesn't help.

You are definitely not using a terminal program with the same kind of
teminal emulation that Lynx is set for (probably VT100/ANSI).

>I've noticed this happens with a lot of European sites (mostly Swedish
>and German) so the Internet standards there must be quite different than
>North American standards as the pages are definitely incompatible.

It is not a matter of Internet standards. The HTML page has no influence
over how the page is presented by the browser. But a simple text page,
without any special formatting at all will probably be visible anyway,
because then not even lynx will need to reposition the terminal cursor.

It just keeps passing the text in typewriter fashion.

More complex pages will cause Lynx to use more advanced terminal features,
and then your terminal program must be capable of dealing with the escape
codes used for that, and those settings must also be activated.

>Is there a North American mirror where I could find these programs?

Probably, but I don't keep track of that, and that is in any case not
the cause of your problem. HTML works exactly the same in all countries.

Well, in my case its more a matter of directing the cooling air. If I mount
a suction fan (like you did) on top of the PSU, there is very little chance
that much of the cooling air would pass by the critical circuits.

>>I've found that works here. I really must get me a tower soon, so I can

>
>Is natural cooling enough if you leave the top cover off?

Not a chance. At first I tried with both top cover and all shielding off,
and the keyboard twisted round so as not to impede the air above CT2B.
No dice. It did work partly, but not for any kind of FastRAM access.

>>I'd like to keep the original case to, but not as the cooling works now.

>>even with a fan of its own. That just might work.
>
>Tricky one as you'd have to stick it on - hard to remove without signs
>should there be a hardware update requiring a swop-out...

I don't really care about the latter, if needed I'd be prepared to pay
for any significant update, and I don't think Centek will do such for

free anyway, unless it concerns definite design errors.

The problem is more of finding a suitable heatsink that fits the available
space, and yet does allow a fan to be mounted.

Hmmm, I wonder if just a normal heatsink would suffice ?
It should at least lower the silicon temperature a bit, and if I also move
the original fan like you did, the combined effect just might be enough.

----- snip ----- re: CentScreen
>
>Agreed - there is too little control but OTOH it's much easier for the

VI also supports virtual screens, but I seldom bother to use that. On a
CT2B-Falcon the choice of physical resolutions makes virtual resolutions
more or less redundant.

Btw:
Speaking of virtual screens reminded me of the time you registered LaceScan,
and wrote that review for AC. Do you still use LaceScan, or have you left
the ST machines entirely in favor of Falcon now ?

----- snip ----- re: VI resolution choice under MagiC
>>

>interfaces extremely well. Thanks for clearing my question up.

What's really needed here is a VIDEOMOD.APP that can replace CHGRES.PRG,
and of course a similar VI2_CNF.PRG that can do the same thing.

>
>As you'll see further down, this is not the case.

Well, it _is_ the mode Falcon was designed for, but I suppose you mean
that some other mode is safe to use anyway.

But more on that below then...

----- snip ----- re: CT2B lack of through-port for expansion bus
>
>Titan (Core) hinted that the real reason was that additional cards
>would put too much load on the Falcon-bus, and that they removed the
>through-port simply because it couldn't be used anyway. Ofcourse, Titan
>is promoting their own accelerator...

In order to make a statement like that they should back it by some
measurements, or at least by tests. Also, unless all their own boards
for the expansion bus (including graphics-cards or adapters for them)
do have through-ports, they are not entitled to criticise Centek for
leaving them out too.

----- snip ----- re: Falcon write cache normally slower than read cache
>
>This is how the 040 does it inn writeback mode, which indeed gives
>poorer performance than copyback (which I always use).

The question is if other cache modes than write-through will cause
problems for various software or not. Only extensive testing can
prove that and, of course, the proof is only valid for software
tested this way.

----- snip ----- re: advantages and disadvantages of 68040
>
>Please note that Motorola has a separate, external bus-sizer which
>essentially is the bus-sizer from the 030. Why this isn't used in the
>AB is beyond me...

Possibly it remains expensive, as all chips are when first released.
It is only those chips that are used extensively in mass-produced
designs whose prices then fall. I have no idea if the bus sizer has
been used in enough popular designs to cause this effect.

----- snip ----- re: not caching DMA buffers
>>
>> What you say requires that each program which sets up any RAM block

>directly by the OS) marks ST-RAM as non-cacheable.

But that would give even worse ST-RAM speed than the nembench shows, so
I don't think it is practical for anyone to do that unless he does have
a graphics-card, like you do.

----- snip ----- re: GEMDOS rules for DMA buffers
>
>Don't forget the FRB-buffer, which is provided in all TOS-versions that
>supports alternate RAM. This doesn't cover all problems ofcourse (it's
>only purpose is to buffer DMA-transfer to/from alternate RAM).

Sure, but its use is in no way guaranteed. Remember that the harddisk
driver is only one of many drivers that use DMA methods. From hardware
viewpoint the DMA buffers simply _must_ be in ST-RAM.

----- snip ----- re: PMMU remapping of FastRAM in Falcon accelerators
>
>But it's strictly not necessary, as there's no rule that says that
>alternate RAM has to be located at specific adresses,

Alternate RAM does not, but TT-RAM does have to be based at $01000000.
The variables that keep track of it do not include any base address.
So if we want FastRAM to be TT-RAM compatible, then it must be at base
address $01000000 at the time that TOS boots.

Still (as described elsewhere), I normally use my FastRAM by activating
it as Alternate RAM, rather than booting it as TT-RAM, thereby avoiding
the instability that follows with the PMMU map used for the latter.

>or even be continuous.

Alternate RAM can reside in several blocks, but this unavoidably lowers
the efficiency of its handling, just like any other fragmentation.

>I'm not even sure if the original AB-drivers did this, as
>I've only used Doug Little's driver.

I have no information on either.

>However, on the AB there's no harm in doing this anyway as the PMMU is
>already used for various things:

>
>1. Set up the cache-mode for video-ram.
>2. Disable data-cache in the FRB-buffer (or entire ST-RAM).
>3. Move TOS to fastRAM and protect it.
>...and 4: Joining the two RAM-banks at the standard TT-location.

You seem to have missed one of my main points:

Steps 1 through 3 above do not 'remap' anything except TOS, and that
is simply moved into FastRAM which is remapped to coincide with the
original TOS. Here we could still have a simple straight relationship
between all logical RAM addresses and their physical addresses.
(Provided that TOS RAM is taken from the top of the range.)

That is what changes in step 4. Thereafter, any program that wants
to reprogram the PMMU will bomb if it happens to be running in FastRAM
and is not aware of the special methods needed for the PMMU remapping
that is already active.

Even if it is running in ST-RAM, it will most likely cause bombs that
occur later, because of inadvertent remapping effects.

All of those effects are impossible if physical and logical mapping
of FastRAM is identical, as it has been in all Atari designs. This
requires that hardware maps the fastram into a contiguous block, with
base at $01000000 for TT-RAM compatibility, or at some higher address
for simple Alt-RAM compatibility.

>> There are other (quite simple) methods that solve the problem better.
>
>In hardware?

Yes. Although there is no problem in letting a boot program, such as
that of the CT2B Flash ROM, set up enable signals for the hardware
before turning the boot over to TOS. That could simplify things.

----- snip ----- re: MiNT and PMMU (why many prefer it as MINTNP)
>
>Without memory-protection MiNT doesn't touch the PMMU at all, so
>naturally then there's no problem with even the most complex PMMU-
>trees. I'm talking about MiNT *with* memory-protection, which currently
>works with Milan and Afterburner (in addition to traditional systems).

But it only does so by having to include code written especially for
that purpose. Of course that can be done, but it is a wasteful way
of doing it. Those programmers could have been better occupied at
making real improvements rather than fixing compatibility problems
caused by the manufacturers of accelerators.

>It does not work on the Hades for one simple reason: The Hades'
>PMMU-tree is set up by an accessory (!), which ofcourse is too
>late for MiNT.

That does sound like an unusually inappropriate method to configure
system hardware. Still, if the Hades designers had followed some
approach like I've described instead, going for compatibility at
hardware level, then it too should have had no problems with MiNT.

>> But with CT2B I don't think we need to be in that corner yet.

>> reprogrammed at any time. So the design is not locked in
>> 'finished' state as long as any support exists.
>
>And since it only has one memory-bank you don't have to worry about
>gaps either. What prevents you for not using the PMMU at all, and
>simply install the fastRAM with Maddalt()?

You must have missed my other posts where I discuss this with Derryck
Croker. You see, that is exactly what I do normally. I boot in the
so-called TOS 4.x mode which does not remap FastRAM, and then I tell
TOS where to find it through Maddalt. The result is that I get a
much stabler system since the PMMU map used for this boot mode is a
lot more compatible to Atari standards.

But this only makes the FastRAM accessible as Alt-RAM, not as TT-RAM,
so there are still some TT-RAM programs that don't work.

>> So it can, and I use that in a utility program I made for my CT2B,
>> so as to enable FastRAM access without getting the really weird
>> PMMU mapping.
>
>Ahh, so it works without using the PMMU?

Yes, but with base address at $04000000, its physical address.

>> But my main objection was not the fact that FastRAM starts at another
>> address, but the fact that its physical address does not coincide with
>> logical address used when it is active. That constitutes a
>
>But this is not the case if you don't use the PMMU? Or what?

Correct. Then both the logical and the physical address are $04000000.
That eliminates the risk I spoke of, but the base used makes it miss
TT-RAM compatibility.

>> specific danger in itself, as it means that any program resident
>> in FastRAM will cause random crashing if it attempts to clear or

>
>Not to mention that the reset-handler won't survive a reset if the OS
>(MiNT or MagiC) was loaded in fastRAM! This is the case on my
>Afterburner, although I've been able to fix that with MiNT since MiNT's
>resethandler isn't needed in my case.

Correct. There is a patch for MagiC to work right in TOS 7.x mode,
but like I said, the weird PMMU map (other things than FastRAM) makes

that mode unstable anyway, with or without MagiC. Centek has denied
that this can be true, but when I see the reality matching what I had
concluded, every time I test it, then I must believe what I see.

I also believe that Centek test with a rather limited set of APPs
and system utilities, so that they never see all the problems that
their users suffer. That is to some extent unavoidable, as they
can't test _everything_, but I was a bit surprised to find that not
one of their documents showed any awareness that STOOP even exists.
(Just to mention one example of overlooked programs.)

----- snip ----- re: Speed factor of graphics-card VS Videl

Let's stop arguing over how to interpret the phrasing of the older
posts in this thread. I have already agreed that a Falcon with a
graphics-card will handle graphics much faster than one using only
Videl. Of course it will.

I took your phrasing to imply an efficiency factor of 10 * 16,
which it is now evident that you did not intend, meaning instead
a factor of 10. As I've already said, I accept that as correct.

>Very impressive, atleast until I noticed "Interlaced" ;-)

That is why I also have the settings that follow, for cases
when picture quality is more important than speed.

>> Test resolution : 640x480x65536_colours 63.5 Hz Noninterlaced
>> Linear 32bit read (ST-Ram) -> 5.152 MByte/sec (~96%)

>10MB/s...

Sure, but then I shouldn't need it much anyway, as there would not be
very much ST-RAM work needed normally, as compared to when using Videl.

Of course. That is the best way of getting the most out of Videl
without overloading the ST-RAM accessibility.

>Are you using a RGB-monitor?
>
I'm using a Nec3D Multisync at the moment, but I hope to repair the
PSU of my 19" multisync soon. Hm, I forgot the name of it, and it's
too d**n heavy for me to turn it around right now. It's from a Mac
anyway. I'll have to define new VI resolutions for it now though,
as the ones I used before mostly used the 32MHz clock which has now
moved to another Videl input.

Yes, and it is the inability to use any Videl-independent RAM that
makes an unaccelerated Falcon so slow. At decent resolutions it is
pretty close to an 8 MHz ST in speed.

----- snip ----- re: speed factor revisited

>16bit) and got 160! ;-)

IIRC you did say that the speed difference between NOVA Hicolour and
Videl monochrome res would be some 10-20 for _all_ work, not average.
That implied the higher factor to me.

Evidently that was not quite what you meant, so let's forget it.
At present we both agree to a factor of 10-20 for average work,
so we really don't have anything to argue about.

>UPPERCASE. With the XFS, it is left to the OS. When you write to a remote,
>BNET uses legal GEMDOS calls on the destination (like Fcreate, Fwrite etc).

This problem has nothing to do with BNet. It is a problem with Gemini.
I've seen it happen with other drives too, and there is a warning in the
Gemini faq that activating lower case filenames may cause problems.

Here is a quote from that faq section: (Sorry, I only have it in German)
==========

28: Ich lasse mir von Gemini die Dateinamen in Kleinbuchstaben anzeigen und
habe dabei unerkliï¿½rliche Probleme. Woran kann das liegen?

A: Mit Hilfe der Option "Dateinamen kleingeschrieben" unter "Extras" -
"Diverses" (Alt-V) kann man sich in Gemini die Dateinamen in Kleinbuch-
staben anzeigen lassen. Dabei ist zu beachten, daï¿½ Gemini beim Ziehen
einer Datei auf ein Programm oder bei Programmen, die auf einen
Dateityp angemeldet sind die Dateinamen in Kleinbuchstaben statt wie
bisher in Groï¿½buchstaben ï¿½bergeben werden. Manche Programme kommen
anscheiend nicht damit zurecht. Abhilfe: diese Option ausschalten.

==========

Note that the explanation above is not quite complete, as it refers
to "Manche programme kommen ansheiend nicht damit zurecht" without
mentioning that one of those programs is Gemini itself. Possibly
the faq author was not quite aware of the extent of the problem.

As Gemini is no longer actively developed, I suggest that Ekkehard
switch to Gemini's closest 'active' relative, Thing, instead.
Thing is capable of dealing correctly with filenames regardless of
their character casing.

Alternatively that Gemini option should be disabled, but there are
other limitations in Gemini too, since it has not been updated for
compatibility with newer developments of MagiC and MiNT.
I really recommend using Thing instead.

Btw:
I'm a former Gemini user myself, and still have it installed, but
newer developments have made it impractical for general use now.
I do miss some of its features, but Thing is the best alternative
still being developed IMHO.

Hello Johan,

I think you missed some of the earlier posts of this discussion,
so I want to clarify my position, so you don't misunderstand it.

In an earlier post Jo Even had described the speedup effect of graphics
cards such that I interpreted him to mean that they were faster than a
normal Falcon using Videl by a factor of 160 for _all_ work. This was
however not what he really intended to say, as recent posts clarify.

But it led me to describe various things, mainly dealing with bitmaps,
which I did not believe could be handled that fast.

Since then he and I have both agreed that for normal usage one should
expect an average speedup in the range of 10-20 for graphics work in
general.

>possible for applications to allocate memory on the graphics card,
>though, which will be perfect for this sort of thing.

Yes, that should help a lot, but the capacity for such things, and the
methods used, would have to vary a lot for different cards I think.

----- snip ----- re: desktop icons
>
>It's simple enough to cache icon bitmaps in local RAM on the graphics
>card. Currently fVDI (on the Eclipse/RageII) does that whenever it
>encounters a 32x32 bitmap that is about to be blitted.
>Further blits of the same image will be a _lot_ faster.

That should also help a lot, but how exactly do you then determine that
it is the _same_ image ? It could be entirely changed even if still in
the same RAM area. Also, not all icons use 32x32 format. Very few of
the ones I use in Thing do.

>It's of course possible to cache bitmaps of any size (like your
>background), but it would be a bit more complicated.

Yes, and much more demanding on card memory.

>I'll probably give it a try in fVDI at some point.

It would be worthwhile of course, as it should save time whenever a
screen object, that has been hiding a part of the background, goes
away again. But it could take up a _lot_ of RAM, especially for high
resolutions with many colours, since it needs almost as much RAM as
the entire active screen (minus menu line).

----- snip ----- re: Desktop/APP menus
>
>Fortunately, there is a way to get at the address of the AES's
>background save buffer and then it's just a matter of redirecting the
>blits to local RAM. fVDI (naturally ;-) does this, and it causes a
>_huge_ speedup of the menus (and anything else that uses the same
>buffer).

Yes, and it is also used by most normal dialog boxes.

Actually this should have some effect even without a graphics card,
if the system has FastRAM that the buffer can be redirected to.
(Like my CT2B-Falcon :-) Though the CPU will still have to do the
work then, of course.

>Applications that do their own buffering will have to suffer the
>consequences. At least until they can use the new fVDI feature that
>I mentioned earlier.

I suppose you mean the way that external APPs could allocate portions
of the VRAM area for their own use. Again, this is something that can
use up a _lot_ of such RAM. There'd have to be strict rules to follow.

>>surfaces are text, in various fonts, and that is of course bitmap data
>

>That is, text will be output at about the same speed as in the normal
>monochrome mode in _any_ graphics mode.

Yes, provided that the driver software does it that way, blitting only
a straight copy of the single-plane data into VRAM and then using the
internal card operations to blit this into the active screen RAM. But
I strongly suspect that some current drivers don't do it that way.

>Also, fonts are easy to cache in local RAM and then it's just a matter
>or telling the card what to blit and where.

That would work fine for the system font, but I doubt that it would be
practical for all fonts. I mean, it would not be sensible to use up
all the local RAM to cache a lot of vector fonts.

>>again. So if we are just measuring amounts here, I'd say that a large
>>majority of my present screen is bitmap-derived.
>
>But I can assure you that (at least using fVDI), everything but the

That would be nice of course, but for the present you confirm my own
suspicion, that the currently available software for Ataris can't use
this stuff properly (yet).

>Perhaps someone would like to dissassemble and analyze the x86
>Direct3D drivers? ;-)
>
Not me, thanks !
I can't stand the Intel CPU models. I have worked with them, many years
ago, and even disassembled some x86 programs, but I hated that stuff.
Those who designed those models must love complication for its own sake.

----- snip ----- re: Speed factor of 160
>
>A number like that could be correct for window scrolling and things
>like that, but in general the speedup is indeed a lot lower.

That factor was evidently a misunderstanding, as described above.

>>Its the reverse here. At least 80% is bitmaps of various kinds.
>
>As I explained above, as long as you don't move windows around (and
>thus don't need to update the background image), things are not as
>bad as you make them sound. Far from it.

I didn't mean to make things look bad at all. I was just explaining
which parts of the graphics operations I felt would be difficult for
graphics cards in general to speed up very much.

Evidently you do agree with me on some of these things, since you too
mention that very special coding would be required to gain significant
improvements of their speed. Coding that is probably not present in
many of the drivers currently in use.

That is very odd. I have always had it in \AUTO\ and never in the
C:\ root, and that has worked fine for me.

>I think that was it. Everthing worked perfectly from that point.
>I have noticed a massive improvement in speed, the lack of which
>I had always blamed on accessing the web via a modem.

It could also be due to some inadvertent setting of a CPX. As
you reinstalled new CPXs now, you also went back to the default
settings of them. A bad MSS or RCV_WND setting may have messed
up the efficiency earlier.

By default, the STNGPROT.CPX does not make any settings active,
but only 'swallows' the settings made by DEFAULT.CFG. But if
you change something in the CPX, and then save the settings,
then those settings will override the values of DEFAULT.CFG
each time that this CPX is booted (by XCONTROL, COPS, et.al).

I never save settings of this CPX, but only use it to experiment
with different settings that I then place in DEFAULT.CFG.

>Now it runs at 1500-3000 and rarely any lower. That's a TEN times
>speed improvement and makes web browsing practical at last. I

Hi Steve,

I have no experience at all with your type of drive, but I do have some
experience of other SCSI stuff used with ACSI-SCSI host adapters.

Two of your settings seem very odd to me.

>SCSI type 1: disabled
>SCSI type 0: SCS1

I have never heard of SCSI type 0 before, and have no idea what the
abbreviation SCS1 stands for, though it could be one of the very early
'non-standards' that preceded the official SCSI 1 standard.

AFAIK all ACSI-SCSI host adapters are SCSI 1, so in your place I would
definitely experiment with those two settings.

>A small puzzle.
>
>Each time I boot, STinG 1.20 reports failure to load the DNS cache.

That means either that the cache file is missing, or that it has become
corrupted in a way that the resolver module can detect. There are some
types of corruption which it can't detect, so occasionally it may become
necessary to delete the file 'manually'.

>STinG seems ot write a new version at each session

This is normal when it can't load the file because it is missing.

>but is then unable to load it at the next.

That, however, is of course not normal.

>I have tried deleting the file to ensure that a new one is written,
>but it still can't load.

At the next boot after deleting the file, loading will naturally fail,
but then it should create a new functional file, and that should load
on later boots.

>It doesn't appear to affect operation, although I assume that it is
>slowing down resolving.

It would cause a lot more DNS queries to be sent than is intended,
rather than looking for addresses in the accumulated cache. But
if the internal RAM cache works ok, you might not notice it very
much, because it only happens once per address per session.

There are mainly three things that affect this.

1: In DEFAULT.CFG you need to have "DNS_CACHE = 100"
though "100" can be changed to some other limit.
(it limits the number of cached addresses)

2: In DEFAULT.CFG you need to have "DNS_SAVE = TRUE"
this enables saving of cached addresses to the file.

3: In DEFAULT.CFG you need to have "ALLOCMEM=100000"
where "100000" can be some other number but should not be lower than
50000 and preferably higher.

The ALLOCMEM value reserves RAM for use by STinG and its modules.
This is the same RAM from which buffers is taken for all data packets,

and it is also used for the internal DNS cache. If this STinG RAM
is exhausted at any time, then caching may fail, and that failed cache
might then overwrite the existing file. That depends on when and how
it happens.

A fourth thing which has caused problems in the past is the use of IP
addresses in numerical form, which are unknown to the name servers on
Internet even though there are real servers at those adresses.

If none of the above seems to fit your problem, then I am out of ideas
for the moment.

I wouldn't mind betting that he milled down from the top of the chip to
access the pin just inside the package, but it would be real "micro
surgery".

I used that technique to fix a broken pin on my STFM's serial port chip.

It would be nice to have emulations of the 8 bit (and indeed the VCS) on the same machine, but I think that you'll be disappointed at the speed!

I tried the 800 emulator from Petr Stehlik's page (www.cyberstrider.org) but even running on a CT2-equipped Falcon it was more like wading through treacle.

Same result today. A good starting speed which quickly dwindled away. Went back to 1.51b which exhibited the same behaviour as before, eg maxing at 1024.

Still not quite there yet.

No UK ISPs directly support the Atari.

Otherwise I know for a fact that the following ISPs will work with the
software you mention:

CiX (strong Atari presence in CiX conferencing)
Zetnet (strong Atari presence with a newsgroup)
FreeServe
Connect4Free

>Does anyone have examples of the dial.scr scripts for these?
I have for all but Zetnet.

>prob may be? Could the floppy drive be going bad? Thanks in advance!

I see no reason to suspect the floppy drive. It has no connection with the
RESET line of the CPU. Harddisk interfaces do have such a connection, but
I would not suspect them of being the prime cause of such a problem anyway.

More likely it is a problem with your powersupply or its connectors. I know
of one case where a similar problem was simply due to a mains power cable.

The connector of it that was plugged into the Atari PSU had become worn,
and was no longer firmly 'stuck' into the PSU connector. Now and then the
vibrations of the computer (Fan, floppy, incidental touches etc) would
cause the mains connector to 'jiggle' causing a momentary 'glitch' in the
supply current, which could reset the computer.

Other, more serious, PSU problems are also possible. These can also cause
'glitches' in the supply current, with same results as above.

This sounds like a retrograde step. I believe LIMITMEM can cause problems
with some programs (eg Calamus) that check themselves and refuse to run if
they've been modified. You can set memory usage within Calamus so there's a
workaround, but does Jinnee tell you it's going to modify the program file
before it does it, so the unwary can make a backup?

Might be worth remembering that there are only a few available configs (0.5,
1, 2, 2.5 (very rare on STes), 4Mb), so if one of these methods gives you an
in-between figure, assume the next highest.

That would explain it. I've been holding back from NVDI5 for the moment as there appeared to be some problems with it (from comments in this group). How's it working for you? I'm also saving for MPC6.1 (English) which is supposedly due some time soon according to the SysSol guy I spoke to in Stafford.

>It's a nice, easy way of configuring screen res's tho', soundly beating any
>of the usual methods isn't it.

I've never been in the position of being able to configure screen res's before, having gone straight from STe to MPC. Are things horrifically complicated on the Falcon? I suppose on MPC you don't have to worry about refresh rates etc as that's all done by the PC, so there is less to configure anyway.

>I guess/hope they have improved since!

This is a matter of much debate. I never changed as they never seemed to get
that bad to me (maybe I have low expectations?). They go through the odd
(generally brief) period of duff connects and then everything sorts itself
out again once they catch up with the new load level. The duff periods are
getting less frequent.

I do remember the period when a lot of Atarians decamped to Zetnet - wasn't
it around the time that AtariNOS stopped working properly with new equipment
they fitted (the Ascend terminal servers) and it wasn't upgraded to match PC
NOS? There were a couple of setup workarounds that fixed it for me, but I
remember a lot of people having problems with it.

I thought I would verify the above using my ISP's Lynx using STalker set to VT100 emulation and it is just as Ronald says. The page was available and easy to navigate. You probably need to check your terminal program settings.

> tested this way.

My experience is that copyback-mode is very safe, even in TOS 4.04. Caches can ofcourse cause problems for some programs, but that's the case with the 030 as well (e.g. try running an older ST-game on the Falcon without turning off the caches) and is usually independent of cache-mode.

As you point out, the only problem is caching memory that can be altered by DMA-devices, but this is solved very nicely with the AB toolkit. With copyback enabled my Falcon is about 20-25% faster when doing CPU-intensive work (like rendering huge HTML-documents or compressing large archives) so it's well worth it.

Why is it so important to the TT-RAM compatible? I can't see any good reasons for that, unless you use some software that bypass Malloc() and goes directly to the hardware.

>>or even be continuous.

> Alternate RAM can reside in several blocks, but this unavoidably lowers
> the efficiency of its handling, just like any other fragmentation.

Correct. That's why it's sensible (IMO) to join these. This should not be an issue on the CT2, since it only has one memory-bank, but on machines with several banks this is harder.

> You seem to have missed one of my main points:

Quite likely. I had the impression that you generally didn't like the idea to use the PMMU for these purposes. My point was that since the PMMU already is in use, you might as well use it to set up a single block of TT-RAM. But I do agree with you, relocating fastRAM the way you described it isn't necessary.

> All of those effects are impossible if physical and logical mapping
> of FastRAM is identical, as it has been in all Atari designs. This
> requires that hardware maps the fastram into a contiguous block, with
^^^

Would be nice, but how easy is it to do this with the countless
RAM-configurations you can get with multiple SIMM-slots and SIMM-sizes
between 1 and 128Mb?

> base at $01000000 for TT-RAM compatibility, or at some higher address
> for simple Alt-RAM compatibility.

Again, I can't see why TT-RAM compatibility is necessary at all.

>>Without memory-protection MiNT doesn't touch the PMMU at all, so
>>naturally then there's no problem with even the most complex PMMU-
>>trees. I'm talking about MiNT *with* memory-protection, which currently
>>works with Milan and Afterburner (in addition to traditional systems).

> But it only does so by having to include code written especially for
> that purpose. Of course that can be done, but it is a wasteful way

No, it does not contain code specifically for the AB- or
Milan-configurations.

> That does sound like an unusually inappropriate method to configure
> system hardware. Still, if the Hades designers had followed some
> approach like I've described instead, going for compatibility at
> hardware level, then it too should have had no problems with MiNT.

IMO it makes sense to develop the OS to work on new hardware. After all,
this is the whole point of having an OS in the first place...

> But this only makes the FastRAM accessible as Alt-RAM, not as TT-RAM,
> so there are still some TT-RAM programs that don't work.

Which ones?

> (it limits the number of cached addresses)

My DNS_CACHE entry was set to 64, I changed it to 128 & no more problems.

Not sure if this helps any - is the resolver expecting a bigger cache?

2842. Mini BBS set up

Newsgroup: comp.sys.atari.st
Date: 1999-05-13 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <373ae56a2e8bccc0@holleman.demon.nl>
Source record: 78838

Hi,

I just set up some kinda mini BBS here which is all menu-driven (sorry, menus are in German but pretty much self explaining).

Basically the stuff will be online for 24/hrs a day, except for when I need the line myself. I won't run the system from my ST, mainly because of the speed limits. The one on my TT is still limited to 38400 bps as long as I haven't got Serial2 up and running but it's a lot better than the 19k2 on my ST with a 14k4 modem hooked on.

For users abroad this will be an expensive way of fetching stuff, but users in Holland might benefit from perhaps a higher transferrate vs. the Internet...

Also there's no long login procedure.

Anyone can login as GUEST, just type "GAST" (please note the spelling) and have access for 20 minutes. You may register (no fees!) and have your level upgraded.

The "Software" section holds the latest copies of Amail, MyMail, Sting, Newswatch, Popwatch plus Boris Cahan's TelVT202, several of Dan's CAB.OVL's and FireNews. I will update where I can, add more Internet S/W and just let me know whatever you want to be available there.

Terminal is ANSI color, this can be set to VT100/ANSI mono or ASCII. Transferprotocol is Z-modem, but can be set to X-modem.

Once in the Main Menu hit B (followed by a "return") to get to the areas.

Finally, the number from Holland is 0412-644411, users abroad should dial +31-412-644411.

Source record: 78842

Hi all CT2 users,

There are a big problem for programmers on CT2 (it's not a problem
for users), this problem exist on Hades/MagicMac/MagicPC:

When 680xx is in user state on an ST(E)/FALCON/TT, a reading (or writing)
in memory $0 to $7FF cause a bus error (err -69 with MagiC). For acces
to this zone you must use a Supexec (XBIOS) or Super (GEMDOS).

With a FALCON + CT2, you can read always this zone, and writing has
no effect in user state.
This problem can causes bugs...

A patch in auto folder exist (use PMMU).
Do you know an URL or an e-mail, thanks ?

Yes, it is strict vt100. Most European sites go this way - North American sites don't seem to have that problem so this is why I thought there was some compatibility problems with PAL and NTSC coding. I'm using Lynx 2.7. I can see the frames as links and the other links as well - but when I click on them, they go to an identical page so it's like an endless spiral.

>
>This is a matter of much debate. I never changed as they never seemed to get
>that bad to me (maybe I have low expectations?). They go through the odd
>(generally brief) period of duff connects and then everything sorts itself

Can't quite recall when I first joined Demon, but I know after just a
few weeks I started having problems. I've got a printout here of
the usenet correspondence I had with Malcolm Muir (unofficial
Demon spokesman at the time - he joined them officially a bit
later) in which he admitted there were various problems. After
this initial period of 'probs' things improved for at least six
months, then all went whacky during July/August/September 1996. After
getting nowhere fast with Demon Support, I cancelled my account in
mid September 1996. The close of account letter from Demon states:
'Although we are aware that obtaining a connection to our servers
during this time was more difficult than usual, Demon Internet are
regrettably unable to offer any form of compensation'.

Not a good way of dealing with valid customer complaints! They also
accept the fact that the problems were at their end, I don't think it
was an Atari only situation.

>out again once they catch up with the new load level. The duff
>periods are getting less frequent.

Good.

>they fitted (the Ascend terminal servers) and it wasn't upgraded to match PC
>NOS? There were a couple of setup workarounds that fixed it for me, but I
>remember a lot of people having problems with it.

When I came back to Demon for a few months in December 1996/early 1997 I experienced nothing but trouble, much worse than ever before, so closed the account again in February 1997. I 'decamped' to Zetnet at this time and apart from a minor password problem (typo at Zetnet), I had no problems with them in the year or so I was with them. CIX then beckoned with an improved package, and gave me what I wanted, so I cancelled the Zetnet account, but only really because CIX was better for me in terms of facilities offered. I still think Zetnet is excellent for Atari users who just want internet access. And their top staff do listen and act upon complaints/problems reported to them by Atari users.

Anyway, all in the past now, CIX are very reliable for me, and I don't hear any other CIX Atari users moaning about service so I guess things are generally OK.

Kind regards

Mike Kerslake

You're welcome, I'm happy to help out.

I used to use Lynx exclusively with a shell account when Anna was still in school (free!). After she lost that account, we switched to CAB/STiK and an ISP with shell access and used Lynx for the times when I couldn't access a page any other way. Now, with the latest CAB/STinG, it has been so long since I've used Lynx that I didn't check the version number because I don't remember how to get to the help screens where the version information is displayed.

CAB and STinG have come a long way!

OK, I opened the printer up. Dip switch no. 7 was set on and all the
others off. I have the printer since new so this is the original
setting. This is _not_ covered by the manual.

If you are familiar with dot matrix printer codes I have a textfile
somewhere with a complete list, and also comparing them with Epson FX
and Panasonic KXP1124 24 printer printer codes.

Sorry I was out of the loop while this thread came up.

The AdSpeed controller is available as both a stand-alone .ACC as well as a .CPX module. Forget the switch on the back. Send me your snail-mail address

(to my Halifax e-mail,
ag352@chebucto.ns.ca
as published in the XEST newsletter)

...and I'll throw these on the disk for you. There is also a special version of Mihocka's Quick ST which was tweaked by Darek and/or the ICD guys to run optimally with this 16mHz card. Only with that .PRG in your AUTO folder does the machine run truly faster than a stock Mega STe. Anyway, all this stuff should have been bundled with the original ICD card, so my sending it all to you constituted mere re-assembling of the original package.

BTW the internal switch for 8mHz really does work, and you can run Notator SL. Notator apprently won't run when the external switch is used.

Furthermore, I want either a short Atari-related article or a `Letter to the editor' for XEST in payment for this. I drive a hard bargain.

John S. Gray

Look out: there are 2 disks around called 'MiNTxx'. One only contains
stuff for MiNT and another (the expensive one) contains MiNTnet with
adminstration and install stuff. Bernd Ebert is the one who made this
last one.

S>box and save the config, but upon rebooting under TOS it's disabled
S>again!

Is there another cpx active, which is also capable of setting the cache status?
E.g. the older general.cpx from atari? If so, disable it (or the System info
cpx, as you like) and try again.

S>Anyway, I can use the Zip drive under MagiC, but not under TOS.

That's due to limitations of TOS. I suppose that the ZIP media are in DOS
format (as sold). To use these media under TOS, you will have to install
BigDos. Or partition them to TOS format, but media with that format won't be
usable on the iMac.

2861. Help! Digital Monitor Vs. Videlity

Newsgroup: comp.sys.atari.st
Date: 1999-05-14 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <373ca44c.0@diana.idirect.com>
Source record: 78707

Hi guys,

today I decided that my Falcon needed a better monitor, so I
splurged for a new monitor made by LG. Only now my settings I had for
Videlity for Hi Res TrueColour isn't working at all! All I get is a
blank screen, and even the Videlity/BSS logo doesn't show up on the
first screen.

Any idea what this could be?

If it'll help, this monitor has 30-54 kHz hf, 50-90hZ vf, VESA plug
& play, Energy Star compliant, resolution 1024x768 NI.

BTW, in all the other modes, the monitor works great. It's probably
the clearest looking monitor I've ever owned. I'd certainly want to
keep this if I can only get the TC working.

Oh, yes, one more thing - I have Nemesis installed.

2862. Re: HD Driver 7.61 (nope!)

Newsgroup: comp.sys.atari.st
Date: 1999-05-14 00:00:00 UTC
From: Nurmix@NO_SPAM_MEsocal.com
Message-ID: <7hiav6$12ha@enews3.newsguy.com>
Source record: 78708

Well, I tried HD Driver again yesterday, with background DMA "off" and I also ran CAF_FIX. Anyway, right away I had a hard drive freeze-up loading a web page with CAB 2.7. However, this time, it sat frozen for about 30-40 seconds, then resumed what it was doing much like ICD - only it took a bit longer.

I then tried NEWSie. Interestingly, it took NEWSie about twice as long to actually LOAD under HD Driver, but the articles (for offline reading) seemed to come in and save to disk a bit quicker. No lockups this time.

Then I did various things on the Falcon, and everything seemed to be working alright with HD Driver, as I didn't have any more lockups - although at one point it told me DRIVE L might be damaged (it wasn't, and I have no idea why it said this - but I couldn't access the drive until re-booting). This never happened with ICD Pro.

But today, things went a lot worse. I was doing a backup with Diamond Back 3 [a program which has performed flawlessly under ICD Pro] of my J: partititon (which I backup to a folder on a SyQuest EZ-230 cartridge), when everything locked up - and stayed locked up. So I rebooted, and tried the program again, but it refused to write to drive N: [the SyQuest] at all. And when I tried to view the drive directory from the desktop it was a completely scrambled mess! And Diamond Edge reported numerous errors and problems. Needless to say, after attempting to fix it with Diamond Edge unsuccesfully, I had to erase that cart and start over - fortunately I had a backup of everything!

This sort of thing has _N E V E R_ happened with Diamond Back III before when using ICD Pro, so I figure it's a pretty safe bet that HD Driver was the culprit. When it locked up in the middle of a backup it must have scrambled the FAT (among other things). Well, that was enough for me. I just don't feel safe using HD Driver now. And after this I'm glad I didn't attempt a de-frag with Diamond Edge as a freeze-up in the middle of that process would be disastrous!

In all my years of using ICD Pro with my Falcon, I don't recall ever losing any data when the hard drive would freeze up - it _always_ continued doing whatever it was doing (reading or writing) after the freeze up. This also applies to reading/writing when there were no freeze-ups. And I've copied large and small blocks of data without any trouble either.

So you can call it a "time out" issue if you like, and you can blame the Falcon all you want. I understand this, and am not denying either claim. But for some reason, _M Y_ Falcon functions better under ICD Pro than it does HD Driver, and for that reason, I must continue using ICD Pro. I just don't trust HD Driver with my data any more.

-Paul

I suppose it's possible, if you have a CGA/EGA video card.

Considering max resolution of 640X200 interlaced, would it be worth it? You might be able to sell it for enough to get a cheap used VGA monitor.

I know there is ExtenDOS Pro v2.4a, but a new ExtenDOS Gold has been released some time ago.

I think all versions are in english. The author Roger Burrows certainly has an english sounding name, even though he is Canadian?

System Solutions will tell you the latest version of ExtenDOS Gold, but as far as I know it doesn't read MacHFS yet. Spin 0.34 DOES, I am told by the author Julian Reschke, read Mac HFS CD's.

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Sorry I missed the beginning of this thread. But definitely The Church of Latter Day Saints is a good place to start. However there should also be local information available in your area. Unfortuneately I don't do any geneology research myself. My Mother does. I first tried Family Tree version 2.26 which was soon updated in January of 1998 to version 2.28 (which corrected a bug I discovered)

to
see if my computer illiterate mother would try it. Sure enough She now has my computer:-) and searchs places on the internet herself, no longer bothering me and asking me to look up FTP sites for her. So if you would like more information, perhaps I can ask her of some other possible sources. Also I have a Geneology Newsletter called ROOTSWEB which is sent to me weekly. Originally for my mom and I am to lazy to stop the emails from coming:-). I can send you some of these for information if you would like. They are about 25k in size.

Later Brian.

I'd sure appreciate if you could double check the manual. My printer has a set of 8 switches. They are quite easy to get at but you have to remove 4 screws in the bottom to take the cover off and they are located under the cover toward the back. If yours is easy to get at can you let me know what settings they are at and what driver if it's Windows.

Falcon SCSI-Bus Micropolis SCSI-Bus Iomega Terminator
#######-----------##########-------------#######--# (only this one!)
ID7 ID0 ID5

Remove termination from your Micropolis.

If u use AHDI, you have to patch it.
AHDI canï¿½t jump over "holes" beetween SCSI IDs.
For AHDI you have to create that: ID0, ID1, ID2 ect..
ID0, ID5 doasnï¿½t work.

Use HDDriver, best way. Also HDDriver supports any ZIP feature.
Your driver must "see" the device while the machine boot up.

Use DOITF030 to found some more words and pictures about your question.

Regards, Robert

Hmm, I don't know I'm afraid!

Perhaps that setting is for printing internal fonts only, but that doesn't
explain why that setting is provided in your graphics mode drivers.

Bonjour,

Dans son message ï¿½ï¿½Re: Calamus printer driversï¿½ï¿½, Derryck Croker a ï¿½critï¿½:

ï¿½ï¿½> Speaking of that, do you know how to print in 600*600 black & white
ï¿½ï¿½>with an HP-690c ? All HP 600*600 drivers I used give a 600*300, so the page is
ï¿½ï¿½>vertically incorrect :-(
ï¿½ï¿½
ï¿½ï¿½Perhaps that setting is for printing internal fonts only, but that doesn't
ï¿½ï¿½explain why that setting is provided in your graphics mode drivers.
ï¿½ï¿½
ï¿½ï¿½Rgds, Derryck

Well, I finally went on the HP web site and got the HP-PCL 3 doc. I
made some tests with the HP-850S driver & cdtg : I finally managed to print in
600*600 by changing the "CURVER" commands (from text one to graphic one,
according to the doc) ant the init commands. It's very nice :-)

If some people are interested, they can send me an e-mail - or wait a
little : this driver may appear on the Invers' calamus web page.

Yes I know, no bus error for:

- writing to ROM.
- acces in user state under $800.
- acces to I/O ($FFxxxx) in user state.

>>A patch in auto folder exist (use PMMU).
>>Do you know an URL or an e-mail, thanks ?

For me, the greater problem is acces in user state under $800, another
PMMU map is required ? Do you know if it's possible to found documentation
about PMMU on motorola WWW ?

>Or rather, what programs do you know that cause problems without it ?

My programs ! It's easy to insert a bug, for exemple in C a pointer to 0,
or in ass: move #0,-(sp) replaced by move 0,-(sp)...
I havn't another computer (ST(E)/FALCON/TT) for made tests.

>As mentioned in an earlier post, I do have a patch for the 'write protect'

At Bravo Sierra Computers you'll find Used and New Atari. Items you've been searching for. Item's new to you and Classic Atari long lost. Have you got Hardening of the Ataris? Check out Bravo Sierra Computers! Have you hugged your Atari today? Buy your Atari & yourself a present today! Buy from someone with 16 years of Atari experience. Buy from someone personable, polite & passionate about His Atari! And if I don't have what you want to buy or I don't know the answer to your question, I'll refer you to someone who does. That's the nice thing about the Atari community and my colleauges in the Atari business. We would rather send our business to a fellow competitor to get what they need than have someone abandon their Atari due to lack of support. For myself, I only use Atari! I get on the InterNet with my Atari ST, I use PageSTream for all my DeskTop Publishing, my DataBase is DataManager ST & besides playing games on my Atari ST I play games on my Atari Jaguar with my collection of Jaguar Games! I won't own neither a PC or a Mac. So buy from someone with a servant's Heart & someone who'll be around to offer you Atari support!

Source record: 78787

I use CAB 2.5/Magic 6/Outside/Sting/Stoop/Videl Inside on my 4meg Falcon with CAB working in and taking memory from my 150Meg P partition (2 Gig drive) to 'surf'. Most of the time stable, but a long page loading often locks up with 'System stack overflow. System Halted'. Have CAB defaulted to load no images and change to load images when get to final page. Work in 800x592x256i on RGB and use Zetnet as ISP.

Any ideas please.

My Mega 2 does the same, but sometimes it doesn't just reset but will
stay in the reset-mode. (60hz screen display. iyswim)

Let me know how you go on with checking the power supply as I may decide
to take mine in for repair.. (wonder how much thats going to cost me!!)

All the best

> then toto1.aif will be a size of 400megabytes(this
> file is empty) ,I have always the sizes:
> toto.aif + toto1.aif = part of HD, the part is full.

This is quite normal if you turn your computer off without exiting CAF
the way you should.
It's due to CAF's handling of the HD space. It reserves all of the
partition you're recording on for audio purpose until you quit the
program. After quitting CAF, this space is made available again.

> I asked Steinberg France about this probleme,they answered
> me laconicly: it looks like to a virus named "spacefiller".

They probably told you to buy a PC or a Mac too - they don't develop any
programs for Atari anymore, so they don't care about your problems :(

> Do you meet the same probleme ?

Only if you make "illegal" exits from the program - like if you switch
the Falcon off witout exiting CAF, or if you get a program crash which
exits unexpectedly or locks up the computer.

> How to avoid the creation of this empty parasite file ?

See above...

> How to erase this empty parasite file in CAF ?

You can't erase it while you're still running CAF - you have to do it
from the Desktop, the normal way...

> What about the answer of Steinberg France,is there a virus ?

Definitely NOT!

> Here is my second probleme:
> -------------------------
> When I load CAF,I can see there is 1megabytes RAM free left on the
> totality of 14mega.

> Is it normal ?

Quite normal. I complained about this fault to Steinberg a couple of years ago, but apparently they never got around to correcting it. You'll be able to use the extra RAM, but actually, you will get a negative value when checking it if CAF...

The problem is probably with the chips inside the computer. Whenever I have
a similar problem to the one you are experiencing, I open up my Mega and
VERY CAREFULLY pry up and reseat *ALL* the chips (especially the square
proprietary Atari chips). If this doesn't do the trick, I have been known
to pry out a chip, put some rubbing alcohol on the contact points, and
wiggle the chip back in.

I haven't had to do this at all since I moved my Mega down to the basement
where the temperature and humidity fluctuations during the year are much
less than on the upstairs floor (about three years ago).

Hope this helps,

Randy Kwak

Note that most (if not all) MagiC utilities (including the file selector),
will NOT revert to Fsfirst if Dopendir() fails. For the moment BNET.APP/ACC
alone (without the XFS) is not supporting the 'modern' calls (they are
optional anyway). Maybe it explains some of your problems using this
Falcon/Milan link.

>VP>Have you tried only with your Falcons and you have problems, or the
>VP>Milan (with MiNT/STinG) is somehow always between them ?
>
>I've tried with the Falcons alone. That's not difficult because the Falcons are
>linked together via Midi (or LAN, depends) and one of the Falcons is connected
>to the Milan via Modem2.
>
Ok, both your Falcons are running MagiC, so you can make two full BNET
installations (including the XFS). Leaving the problem with screenblaster on
your Falcon #1 for the moment (I'm sure you can live without it for a while,
to help me find any bugs ;-), have you a usable network between the Falcons
or not ?

>VP>Sorry, this is not clear to me. How can you access files from the
>VP>Falcon on the Milan, but the Milan doesn't pop up on the Falcon ?
>VP>Where should the Milan 'popup' ?
>
>Let me say it in other words... (guess english isn't the mother language for
>both of us ;-)
>
Yep, sure it's not ;-) And 'from' or 'to' is always confusing in networks,
more when there is no client/server.

>First, I started the STinG connection between Falcon #1 and Milan.
>Second, I started BNET.APP on both the Milan and the Falcon. No XFS on either
>machine, but multitasking available through MiNT and MagiC respectively.
>Third, I opened the newly available "P" Drives on both machines.

>Fourth, I saw the Falcon1 entry on the Milan, but no entry on the Falcon.
>
Please check your HOSTS.INF file on the Falcon. Make sure it's on the same
place as BNET.APP/ACC. Do you get an empty drive P:\ or is just the Milan
entry missing ?

>Fifth, I tried accessing some files from the Falcon on the P: drive that
>resides on the Milan and was able to both copy files from there to the Milan's
>harddisk as well as from the Milan's harddisk to the Falcon.
>Sixth, I encountered some kind of transmission problems as the transferred
>files were corrupted.
>
Well, that's the tricky part. Since none of us has ever experienced data
corruption with BNET under MagiC or single_TOS, that makes me believe that
something is wrong with the combination of MiNT/STinG/BNET. Since you don't
have problems with internet access and BNET 'steals' Trap #1 when its XFS
is not installed, this is something I have to check. I know that MiNT does
not like stealing its trap which it has stolen from the original ROM OS
etc ;-) Although BNET does it legaly (with XBRA etc), I have to suggest to
not use it until I make some tests, and maybe find a way to make it more
MiNT friently. It's not a bad idea though to check your STinG settings, ie
MTUs, STinG internal memory etc.

>Seventh, I shouldn't always start these sentences with "I" ;-)
>
Maybe, but it's more acurate for bug reports ;-)

The ST NEWS Lamentation pages (at http://stnews.atari.org) have been around for a year. Cause for some celebration. The pages have been overhauled, *al* music ever released in ST NEWS included (except for one track) added, and all external links checked. Check it out and leave a congratulatory message on the guestbook if you like...

Well, I've urchased an epson stylus 440
Great thing but the doc is completely empty of interesting matter
SO i'm looking for ESC/P Raster code to modify the littles utility
I've made for my old HP500 (my son is happy to get it !)

Please give me code !!!

Oh! If someone has codes of an old 24 pins epson printer it's good
for me cause i'm preferently looking for caracterz tables and font
sizes avalaible to adapt with superbasepro

ok that's all folks !!

cordialement,

2899. Hard Drive Partitions over 500megs on Falcon

Newsgroup: comp.sys.atari.st
Date: 1999-05-15 00:00:00 UTC
From: phantomm@kih.net
Message-ID: <7hkau2$31d2@news.ajou.ac.kr>
Source record: 78652

Recently setup several 800/900+ hard drive partitions on my 2.5 IDE.
Using HD Driver with TOS 4.04 Falcon. This works fine. Only
problem I have ran into is finding suitable software to defrag these
large partitions. So Far the only one I have found that works
correctly is ZORG which by the way is FREE! IIRC. However I have ran
into a problem with ZORG. It seems that if I have a very large amount
of files/folders on a partition, ZORG will run out of MEMORY?
This on a 14meg Falcon.

Anyone know a solution to this problem?

BTW, I know I can copy the partition over some where else to defrag
it, but thats a long way around the problem.

Also, Bought Hard Disk Sentry v.1.35E NEW for $39.00. Well the damn disk would
not work on the Falcon and I had to send it back to ChroMagic for
replacement. Still waiting for the replacement disk.................
I hope this isn't going to be another Disk Disappearing Act.
Like the Original Apex Media Disks that I never got BACK!!!
Cause I damn sure aint going to put up with that crap any more!

Anyone know if Hard Disk Sentry will work on partitons of 800 to 900+
megs? Probably won't but I thought I'd ask any way.

If there is any other software that will work correctly on a Falcon
IN TOS 4.04, then I'd like to know about it. If it don't work in TOS
4.04. I don't need it. Not going to setup some screwed up partition
scheme just to run defragging software.

2903. Modem - Unusual Problem Sportster 14.4 - HELP!

Newsgroup: comp.sys.atari.st
Date: 1999-05-15 00:00:00 UTC
From: Kate and John Norton <jnorton@bwn.net>
Message-ID: <373de1d5.0@news.bewellnet.com>
Source record: 78656

We did some furniture rearranging and the power supply for my external US Robotics Sportster 14.4 modem got mixed up with some other power supplies or simply got lost.

I want to get my Mega ST back online.

Does anyone use the Sportster 14.4 (or have an old one) and would look to see what the specs are? I think I need the wattage, voltage output and mA (milli amps?) so I can match it up to a power supply.

The book is no help as it doesn't list any of these.

Thanks,
John Norton

I'm an Atari8bitter mainly but aquired a mega 4 ST a couple of years ago. I have a few questions.

My system is a mega 4 with a tweetyboard, an ICD Link II scsiface, a 600mb scsi hard disk, and a 38800 Hayes modem.

I have Mint and a cdrom running but the MiNT is a very early beta version.

Questions:

1) How do I get Web surfing going on this system? I am about to try Stik and cab but the docs don't make much sense to me. Help would be appreciated.

2) I have a line on a version of Linux which will run on the 68000. Anyone have more info on this?

3) Can I network this machine other than via serial line?

4) What upgrades are available?

Or install freeMiNT 1.15.1. With MiNT you don't need to use BigDos
anymore. The Zip media as they come from the factory (IBM formated) can be
used without the need to partitioned them to TOS format. This way it's
very easy to swap the media from system to system.

Nothing much. Just a PowerPC (MPC8240) at up to 266MHz...
(I don't think the clock rate of the Tempest has been decided yet.)

At 266 MHz that processor reaches 375 MIPS (Dhrystone (an old integer
test program)), which should be ten or so times faster than an '040.
At floating point the difference is probably even larger.
(Estimated SPEC95 numbers are: int 6.6, fp 5.5)

okay. I seem to be getting somewhere.

I dug out the HRTC program from the Nemesis disk and installed that
- and it booted up in 640 x 480 TC mode.

Now, if anyone knows what the frequency rates for this one are, I
think I can start experimenting with this puppy under Videlity. Any
thoughts?

I'm not at all certain of this - there are too many parameters to vary
- but there does seem to be some incompatibility between MAGIC v 6.01,
HD Driver versions > 7.00 and STinG 1.20.

The problem I have described occurs with HD Driver v 7.71. It seems to
disappear if I revert to HD Driver v 7.00

Has anybody any theories?

Something vaguely similar happened with my ST - it had a tendency to crash with a weird botched horizontal scan when the hard disk was accessed, particularly on startup. It took some time to diagnose; at first I thought it was a software problem, then a serious problem inside the ST (I thought it was dying). It was a rather weird - the ST had a tendency to crash continously for my mum, but when I had a look at it, it worked first time - after I moved it to a more comfortable typing position.

It turned out to be a bad contact in the hard disk socket, which was fixed with a spot of Servisol and a flathead screwdriver - I bent the pins in the plug apart slightly, so they actually touched the contacts. The ST hasn't had a similar crash at all for months, and looks like it might last another ten years (it's used almost daily by my mum).

Just another possible solution...

Adam Foster (now happy with numerous PCs running Linux)

:> i've d/led a program called WinSTon (Atari emulator for PC)

: Joe Connor (joe@inactive.SPAMBLOCK.cix.co.uk) wrote:
: Try TOSBOX instead.

ta. i d/led that one. it works better than WinSTon for Phoenix. no crash (so far), but it does not like running FLM/SEQ/DLT's too much. and on Diamond Back it only seems to be able to read some of my split files, not all of them; which, unfortunately leads to it not transferring it at all.

i may experiment with restoring them in the STe, then re-transferring them to the PC. very time-consuming, but i'd like to have full access to my anims. will probably have to break them down into their constituent parts (degas files), use ImageCopy to flip them to GIF's, then re-compile them in the appropriate PC program.

pity there isn't an FLM, SEQ or DLT to AVI convertor for the ST. i'd thought that Lexicor had made something like this, but all i could find on my disks were various FLI/C/X inter-changes. may take another dig through UMich and see what's been added since the last time i browsed.

oh yeh. does ICD still exist? i'm using their Link2, but i wouldn't mind finding out what updates there's been to their software since i bought it. quite a few i'd expect.

anyway, thanx.

In that case it may of course be a Kobold problem too. It does not deal at
all properly with some pure GEMDOS file systems, and would really neead to
be updated to gain some capabilities. Kobold copying only works right for
me on a few of the filesystems that I use (even in GEMDOS mode).

Kobold is very good at the things it was made for, but it has not been
updated to deal properly with all longname and link issues.

I really believe that BNet deals correctly with the filenames, as there is
no problem when I let Things's built-in copier access BNet, either for the
source or destination.

>RA>(Sorry, I only have it in German)

It takes work to configure it fully of course, but it is well worth doing.

>some minor limitiatons, but I can live with these.

That is up to each user of course, but I think you would gain by updating
your system to use Thing, as many things have been developed since Gemini
was last updated. This applies both to modern filesystems and AV-protocol
extensions as well as various multitasking compatibility issues.

I know nothing about that RAM card, but I don't think the problem is due
to any fault in M_player. Being a registered M_player user, I have used
it quite a lot, and it does work fine in the FastRAM of my CT2B, even if
that is activated on the 'physical' addresses that do not match TT-RAM.

It is, and that normally should be enough. Extensive surfing may cause
more than 64 soymbolic addresses to be resolved, and then it is useful to
have a larger value, that is all.

----- snip ----- re: DEFAULT.CFG setting "DNS_SAVE = TRUE"
>

>rebooted. Cache loading failed again.

Weird. I hate things that work 'intermittently'. They are always hard
to debug, as the 'intermittent' stuff never happens when you expect it.

Just a wild shot:

Running out of STinG RAM is one of the things most likely to disturb the
resolver module and its handling of the DNS cache file.

Have you tried raising both DNS_CACHE and ALLOCMEM to some higher value
at the same time. (eg: 200 and 200000) If that makes any difference we
might get some clue from that. Also, what are your MTU, MSS, and RCV_WND
settings. These all contribute to consumption of STinG RAM, and that may
contribute to this problem.

Do you often have connection failures where it seems as if a server just
drops the connection ? If they do, and do not close the connection
properly, then there may be a time delay before the RAM blocks of that
connection can be released. Also, if clients are killed without having
closed connections, then some STinG RAM may be locked away until the

next reboot.

You can inspect the amount of STinG RAM available at any time by using
the memory tools of STING.CPX or of the dialer. This will show both the
total sum of STinG RAM free, and the largest contiguous free block.
Note that a _lot_ of fragementation of STinG RAM is quite normal, so
there may be a large difference between total sum and largest block.

>A problem with the size of the file being written and read perhaps??

I can't deny the possibility, as I don't fully understand what is going
on with your system yet. If true, then the big question is why it does
not happen more consistently for other users. That is why I believe
that there must be some other explanation.

Ooops! I forgot to test the last item myself. That really needs to be
fixed. Else any user APP running amuck can ruin the hardware operation
with fatal consequences to harddisk writes that then follow etc. That is
why we need these bus error signals, so that programs doing such things
are stopped at their first illegal move.

I'd better start making a new patch for this then.

>>I have not bothered to make a patch for the 'super' stuff, as that does

>>I do know how to do it though, and may do so later. Why do you need it ?
>
>For me, the greater problem is acces in user state under $800, another
>PMMU map is required ?

Yes, but it is not all that hard to do. Most of the map can remain as-is.
But a new sub-table is needed for the low ram area, to allow using the
supervisor flag, as that does not exist in a 32-bit page descriptor such
as the present map uses. A small TSR program can solve this.

>Do you know if it's possible to found documentation about PMMU on
>motorola WWW ?

I have never looked for it, but they usually put the entire CPU manuals
up for download in PDF format. One reason for _not_ using those files,
however, is that they are also fairly generous about sending free copies
of the finished manuals (much preferable to homemade printouts). It may
help if the request for documentation is phrased such that it appears to
be needed for a commercial project involving Motorola chips. ;-)

AFAIK they have never refused such requests.

I'm not sure if all of the PMMU info is available in a single manual now.
Motorola has organized manuals differently over the years. The ones I
have use a common "Programmer's Reference Manual" for 68000-68040 plus
68851/68881/68882, all in one volume. But the real 'nitty-gritty' on the
PMMU is found in the "Microprocessor User's Manual", which came as one
separate manual for each processor type.

>>Or rather, what programs do you know that cause problems without it ?

True, it helps debugging to have all illegal accesses cause an exception,
especially when using a debugger that can 'catch' them, like MON/AMON.

On a 4MB Falcon, using MagiC and the normal boot stuff needed then, such as NVDI which you do not mention but I assume you use anyway (CAB wants it), there is not much memory left when you have booted up into a decently recent desktop.

Using OUTSIDE is no real help in this, as very few autofolder TSR's are capable of being swapped without problems (NVDI, STinG, etc), which is why OUTSIDE also ignores swapping for normal TSRs. This is absolutely necessary as interrupt routines do not normally support being swapped. (They are time critical, and may conflict with harddisk access anyway.)

This means that not much RAM will be available for virtual memory swapping and that leads to 'intense' swapping when running any large applications that need a lot of memory, such as CAB.

In all cases I have seen that leads to MagiC bombing (sooner or later) in the way you describe (with some variations of course). I do not think this has anything to do with either STinG or CAB as such, but rather that it indicates a generic problem that MagiC has with supervisor stack allocation and RAM allocation in general. This is naturally further strained by the virtual memory swapping which causes stack intensive calls to be made from inside other system functions, thus using the stacks to a much greater extent than would be the case without virtual memory.

The only good solution is to upgrade to more physical memory, and the easiest way to do that is by aquiring a 14MB ST-RAM board.

>
>My Mega 2 does the same, but sometimes it doesn't just reset but will
>stay in the reset-mode. (60hz screen display. iyswim)

That is probably due to oxide or low contact pressure in the PLCC socket
of the 'GLUE' chip. Such aging problems are quite common on older machines.

I don't think it is the PSU in your case, as a power glitch would not
prevent the system from rebooting normally in 50Hz mode. But a 'GLUE'
running 'marginally' due to bad socket contact has been known to
cause such effects (and worse too).

Careful cleaning, and 'flexing' of socket pins, can restore such a machine
to original reliability. I had to do that for all of the socketed chips
on the TT I acquired some time ago, before it would run reliably, as this
was one of the oldest TT models.

NB: _Never_ attempt to 'flex' the pins of the PLCC chips themselves, as
they will inevitably break then. You can clean these pins, by careful
'rubbing' with a blunt metal edge (eg: small 'flat' screwdriver), but
all bending of the pins must be avoided.

The 'flexing' I recommend only applies to the contacts of the PLCC sockets,
and even so it must be done with great care. If you do not already realize
what I mean, then you are probably not the right man to do it... ;-)

Often just removing and then reseating the chips will be sufficient to
establish proper contact again. Just be careful about how you remove
the chips, as it is possible to break them (or even the PLCC socket),
and make sure you never try to reinsert them with wrong orientation.

What board is that ? I've never seen any such board.

>Is it parity or non parity ?
>If parity 3 or 9 chips ?
>If non parity 8 chips or 2 ?

As Falcon does not use RAM parity bits they normally do not matter.
Some CMOS RAM chips may want the inputs for parity to be grounded,
to avoid static voltages, but for most designs this has no effect
on the bits that are used. It is the same for SIMMs in an STe.

The best solution is to not use 30-pin SIMMs at all, but to use
a 32 bit wide modern 16 Mb SIMM instead. That is what I have in
my Falcon (using a homemade board). The SIMM is actually 36 bits
wide, but the four parity bits are simply ignored.

I think only non-EDO SIMMs are suitable for such use, as EDO SIMMs
may cause RAM-databus conflict with Videl. (I never tried it though.)

>At floating point the difference is probably even larger.

That is all very well, as far as PC usage goes, but if we want a power PC we can go right out and buy one. That'll probably be near the same price, as they are being mass produced to a much larger extent than any design specific for the Falcon (or any Atari computer) can be.

The important thing to us Atari fans is how fast it will be when emulating a 68030. It will probably still be pretty fast, especially if the 68030 emulation is implemented as a native RISC code program, but it will still have to be way slower than the raw specs say, when measuring effective speed of the CPU emulation. A 'nembench' result file produced on such a system would tell us more relevant data, for use in comparing the speed to that of other Falcon accelerators.

Compatibility to Falcon will probably be a lot better than for most other Atari emulators, as all Falcon hardware will be accessible, but for those things the speed will be pretty normal, precisely because it is the same hardware.

All in all, it is an interesting project, but we need better estimates of the effective speed to be expected when that board is running 68030 code.

I doubt that very strongly indeed.
I myself only use MagiC 6.00 and HDDriver 7.51 at the moment, so I can't
disprove your hunch, but I think others can do so.

>The problem I have described occurs with HD Driver v 7.71. It seems to
>disappear if I revert to HD Driver v 7.00

If that is indeed the case (and I doubt that it is the real cause), then
that could be due to a bug in HDD 7.71 of course. I don't have it myself,
so I can't test that. But I fail to see what kind of problem would affect
only the STinG resolver this way.

>
>6.1 Have I missed a lot of versions ?

Nope: they've just standardised the numbering across platforms:

PC 1.2 = Atari 5.11 = Mac 2.?

PC 6.1 = Atari 6.1 = Mac 6.1 (not sure if the Mac version is out yet)

MPC 6.0 has definitely been out for a while in Germany. The SysSol guy said
they were waiting for 6.1 as it was due any day, rather than releasing 6.0.
No real indication of time scale, though.

It's supposed to be very much faster and has lost the 14Mb memory limit,
among other goodies.

>
>The response was fairly long, and rather 'angry' in its tone,

That's hardly surprising. Core Designs really jumped to a big conclusion
about the missing thro' port, but OTOH Centek didn't do themselves any
favours by saying that the port was only for Fenix development.

>contain some new and vital information for CT2B owners. It describes an
>add-on through port, very similar to the design which I suggested in a
>recent discussion here. In fact Centek have already built it, and have
>used it in successful tests with some graphics cards.
>(So much for Titan/Core veracity.)

Exactly.

>Another mail from Centek also mentions that they are now planning for the
>next CT2 production series. This will be identical to the CT2B, but will
>be renamed simply to "CT2" without any letter at the end. The reason for
>the new production is that the old series is already sold out !

Wouldn't it be nice if the thro' port reappeared!

>(Non-french retailers might still have some in stock though, I don't know.)

System Solutions do AFAIK.

Good news. What kind of spray did you use? My cousin did something similar with his old STe a few years back. This kept failing every so often, so in the end his simply whipped off the case and sprayed it with WD40. I couldn't believe it and thought what an idiot, but it worked for years after :)

I managed to find a copy of Spin on the net, but it was the German
version.. Anyway, it appeared waaay more complex to set up compared to
Extendos <chicken, I know.. but it was all in German> ;-)
I think I'll give System Solutions a call and ask them to be sure, as
I'd like to stick to Extendos if I can. This app never fails to impress
me, it is so easy and user friendly imo.
Thanks for the reply anyway, appreciated.

Yep, same here for my BBS which uses an Adspeed equipped Mega ST4.

Unless...you try to view Spectrum or Photochrome pictures. In that
case you have to drop back down to 8mhz, since their software is
hard-synched at that speed...Note that the Adspeed software is just
great for this too, an option allows you to list the software that
you want to use at 8mzh, and it will switch automagically when you
run any from that list... Very cool. ;-)

The default value for DEF_RTT is 50, not 200. Anyway, changing this
value to 200 yielded 775 CPS; 500, 2400 CPS; 800, 2450 CPS. I've left it
at 500. Uploads are now almost as fast as downloads. Thanks -- nice fix!

So I obviously was even more generous than I thought :-) Well, I can top this...
>
> But it would be great if you could port it to something more modern.
> Java might be more future-proof, but then maybe not...

"maybe not" exactly describes my sentiments about Java :-) . Anyway, I am already pretty far into doing a X-plat ANSI-C version of Gilgalad, using the original data files, some recent hands on experiences :) and some glimpses into the binary.

As it stands (on a Mac for the time being) only the surrounding screens (title, high scores, Instructions, game over), the artifact pickup/use, the message scroll, the big critters, the level change, some scoring/life things and the fading effects are missing. But it already sports nearly identical graphics, a timing pretty close to the original ST version and of course its decade old unique twists and bugtures...

Ports for Windoze and probably Linux/X11 are planned and will probably be quite easy to do since the amount of platform dependent code is fairly small. This time the source code will also be PD, so maybe I will be able get it from the net another decade later, just in case I'll have lost it again :-)

>
> BTW, you don't have a version of it where one has some more live at the
> beginning? I am sorry to admit, but after all these years I never

> more frequently the last weeks and maybe I'll make it this time...)

The word at offset 9854H into the Gilgalad binary contains the amount of "live" you have at the start of the game. It should contain 0bb8H in an

unmodified binary. The things you find out when you try to dig out info
from an old binary... Btw: level 5 was also the farthest I got without
dirty tricks IIRC.
>
> > Markus
> > (who had many plans for a sequel to Gilgalad... ...maybe some day...)
>
> YYYEEESSSS. PPPLLLLEEEAAAAZZZZZEEEEE!!!!!
> %-)))))
>
This looks very convincing ;-) The plans consisted of isometric
graphics, some roguelike twists, bigger and somewhat randomized
landscapes and generally a more varied gameplay with puzzles and
multiple ways to accomplish goals. Color is still right out :) Since
I've rediscovered the joys of game programming and furthermore have
regained contact with the artistically inclined guy who provided quite a
lot of inspiration back in the time of the making of Gilgalad (we work
at neighboring desks now after having lost contact for about a decade)
the plans are probably more likely to be implemented than ever before.
The biggest problem I see is doing the graphics. It's a lot of work and
I am never ever satisfied with the graphics I do. This includes
Gilgalad, which has some good stuff (esp. in the temple level) and in
the last level but also a lot of rather poor and cheesy work. IMHO.

> BTW, on the disk where I have Gilgalad there were two other games from
> you. A very good port of Space Invaders, and Anduril (I think that was
> the name). Although I did not like Anduril in particular too much (but a

> my Anduril-Charts, grrr), it still is that type of games of that time
> that I like. So I always wondered if you made more programs like those?
> And maybe do you even have them somewhere??

Well, there were some Sinclair ZX81 games, some ZX Spectrum games, some
TI99/4A games, all of which surely have fallen prey to tape rot. The
three mentioned games were the only Atari games I can remember. There
were/are also color (Eeeek!) versions of Invaders for the Acorn
Archimedes and the Mac. Gilgalad was probably the best game I ever
wrote, just before Little Painter for the ST somehow sucked me into the
treadmills of commercial "serious" programming.
>
> Ciao, and thanx for this great game!

It was (and apparently still is) a pleasure. I was overjoyed to read
that someone still plays Gilgalad. Dejanewsing for my (fortunately
pretty unique) name (oh, the vanity...) sometimes yields pretty
interesting results after all :-)

Steve,

I too am a die-hard ExtenDOS user. It is indeed very easy to use and reliable....

Or was until I switched to MagiC for most of my needs. Now ExtenDOS will not find the CD ROM Drives I have when run under MagiC, even though the exact same setup runs flawlessly under plain TOS (both 1.04 on my STacy and 3.06 on my TT).

I switched to Spin a week ago and even though it is a bit more involved to set up than ExtenDOS I like it a lot.

I seem to remember that you were installing this under MagiC, right? Well, installation for MagiC is a bit easier than for plain TOS. Derryck Croker's(?) translation of the docs is an absolute must for us language-challenged types tho. <G>

Good luck,

Joe Mirando @ A-ONE Magazine

>at the same time. (eg: 200 and 200000)

I tried raising ALLOCMEM to 200000 and DNS_CACHE to 128. At first, after a couple of short sessions I thought that this had cured the problem. But then I stayed connected until STinG had written to the CACHE file twice in the session, and the problem returned.

>might get some clue from that. Also, what are your MTU, MSS, and RCV_WND
>settings.

MSS = 2000; RCV_WND = 5000; I don't have MTU set in any configuration file but PPP negotiates it at 576 for one ISP and 1500 for the other.

>Do you often have connection failures where it seems as if a server just
>drops the connection ?

The only client I use that has crashed at all in recent memory is CAB 2.7 and that only rarely. My ISP connections have been very reliable for months now. Despite the problem with the CACHE file, everything seems to work smoothly and reliably.

>You can inspect the amount of STinG RAM available at any time by using
>the memory tools of STING.CPX or of the dialer.

I've had a couple of looks. RAM does not seem to be scarce.

>ta. i d/led that one. it works better than WinSTon for Phoenix. no crash
>(so far), but it does not like running FLM/SEQ/DLT's too much. and on

If you like cyber SEQ files then what about a player that lets you
pack them with any of the best atari packers (atomix, pack-ice ect)
dont they pack down small!!.

lets you make a cfg file so no file selector (unless you want one) can
work as an APP or an autobooting program.

lets you play sampled sound or chip music or BOTH without slowing down
the animation..

Works on all STs and falcons

Ho blimey so many things..If you have cyber SEQ files then you should
get this... go to this url

Bonjour,

J'ai fait un site sur l'Atari ST qui regroupe pleins de jeux, les derniers
émulateurs du moment, des utilitaires pour votre ST et bientôt un peu
d'histoire sur la firme Atari et sur cette superbe machine.

S'il vous plait dites moi ce que vous pensez de mon site. tout vos
suggestions sont les bienvenues.
Merci de votre aide :-)

>
>1) How do I get Web surfing going on this system? I am about to try
>Stik and cab but the docs don't make much sense to me. Help would be
>appreciated.

Two main routes:

1) Forget STiK, go straight for STinG. You might find the step-by-step guide at:

http://www.whalley.demon.co.uk/atari/texts/stingset.html

useful, at least in terms of pointers to getting started even if it doesn't work first time. No guarantees, mind, as ISPs vary so much. If you don't currently have web access, mail me (NB warning in sig about the address) and I can mail it to you. STinG will work under TOS, MagiC and MiNT (but not AES 4.1 - original MultiTOS AES 4.0 is OK, as is N.AES and Geneva).

2) If you are keen on MiNT, there is MiNTnet, about the innards of which I know next to nothing except it's only straightforward if you are Unix-friendly! It is the most comprehensive net solution available for Ataris, though, in terms of clients and servers. You will need a more recent MiNT, though.

>2) I have a line on a version of Linux which will run on the 68000.
>Anyone have more info on this?

I'm guessing, but I would expect it to be painfully slow due to the lack of FPU, so needing emulation. Also you will probably not have enough memory to run any graphical clients (With the MiNT version of X you can't do much in 4megs, so I would expect Linux to be similar). For a Unix-alike you're better off with MiNT on an 8MHz 68000 machine.

>3) Can I network this machine other than via serial line?

Yes: you can use the MIDI ports, or the parallel port (though the latter is limited in application). There are various people beavering away at ethernet adaptors, though I'm not sure how progress is going.

>4) What upgrades are available?

Software or hardware?

>Hello Johan,
>
>I think you missed some of the earlier posts of this discussion,

No, I've read the entire thread.
I just wanted to point out a few things.

>>updated. I intend to add a new feature to fVDI that will make it
>>possible for applications to allocate memory on the graphics card,
>>though, which will be perfect for this sort of thing.
>
>Yes, that should help a lot, but the capacity for such things, and the
>methods used, would have to vary a lot for different cards I think.

Certainly. It's a lot better if it's possible, though, and I think it
could be done transparently (as in the buffer being put in normal RAM
if it doesn't fit on the card).

>>It's simple enough to cache icon bitmaps in local RAM on the graphics
...
>That should also help a lot, but how exactly do you then determine that
>it is the _same_ image ? It could be entirely changed even if still in

I put a marker and an index into the first long word of the image data
in RAM. The cached data is not used if those aren't correct.
This could of course, theoretically, still cause problems if an
application modified part of the bitmap, but I don't think that's
very likely. If it happens, you can turn off the caching.

>the same RAM area. Also, not all icons use 32x32 format. Very few of
>the ones I use in Thing do.

I've not seen file icons (which is the only ones I think it's worth
worrying about (since other icons are not likely to be drawn very often))
of other sizes, but I'm aware that some desktops can handle them.
Could you perhaps point me to some archive that contains a few I could
test? What sizes are your icons, by the way?

>>It's of course possible to cache bitmaps of any size (like your
>>background), but it would be a bit more complicated.
>
>Yes, and much more demanding on card memory.

The Eclipse/RageII is apparently going to be sold with a 4Mbyte card,
so as long as you stick to 16 bit colour there should normally be plenty
of free space.

In any case, caching won't ever hurt performance so that you'd notice.
It can only help.

>>Fortunately, there is a way to get at the address of the AES's
>>background save buffer and then it's just a matter of redirecting the
>>blits to local RAM. fVDI (naturally ;-) does this, and it causes a
...
>if the system has FastRAM that the buffer can be redirected to.

IIRC, the buffer will normally be put in alternate RAM if you have any.
If not, it could of course be very helpful to redirect it.

>I suppose you mean the way that external APPs could allocate portions
>of the VRAM area for their own use. Again, this is something that can
>use up a _lot_ of such RAM. There'd have to be strict rules to follow.

It's definitely better to put the available memory to use than to just
leave it empty. Also, since allocation of such memory would have to
be done via a VDI call, I don't see why there should be any need for
rules of any kind.

>>That is, text will be output at about the same speed as in the normal
>>monochrome mode in _any_ graphics mode.
>
>Yes, provided that the driver software does it that way, blitting only
>a straight copy of the single-plane data into VRAM and then using the
>internal card operations to blit this into the active screen RAM. But

I don't know how other graphics hardware does it, but in the case of
the mach64 kernel, you don't even have to blit into a temporary buffer.
The mach64 will do the expansion on the fly.

>I strongly suspect that some current drivers don't do it that way.

If they don't they will be very slow indeed, but I have never seen
anything besides the NOVA VDI in action.

>>Also, fonts are easy to cache in local RAM and then it's just a matter
>>or telling the card what to blit and where.
>
>That would work fine for the system font, but I doubt that it would be
>practical for all fonts. I mean, it would not be sensible to use up
>all the local RAM to cache a lot of vector fonts.

Since we're talking about a cache here, that isn't a problem. You
just have to use some kind of replacement algorithm to make sure that
some fonts can be removed when others need the space.
You have exactly the same problem with normal RAM for that matter.

>>As I've described above, there are various ways to keep the amount of
>>such data down.
>
>Agreed. But do all drivers use those ways ?

I'd be surprised if not everyone made use of mono-expansion, but I
think fVDI is currently alone in supporting the other ways.

>I can't stand the Intel CPU models. I have worked with them, many years
>ago, and even disassembled some x86 programs, but I hated that stuff.
>Those who designed those models must love complication for its own sake.

You have to remembe that the x86 CPU architecture has its roots in the
4004...

Since you're into MiNT, I suggest looking at:
<http://yescrew.atari.org> for the newest MiNT apps.

> 3) Can I network this machine other than via serial line?

a) PLIP is possible using MiNTnet

b) Ethernet... if you can find one of the Riebl cards that
Atari Germany once manufactured. There are drivers for
STinG and MiNTnet.

>That is all very well, as far as PC usage goes, but if we want a power PC

Note that I said PowerPC. That is a Motorola/IBM processor family, used
in the PowerMacs for example.

>we can go right out and buy one. That'll probably be near the same price,

If you took a look at the WWW page I mentioned, you'd notice that
Core Design hope to be able to sell this thing for less than #200 (the
hash is supposed to be a pound sign).

>as they are being mass produced to a much larger extent than any design
>specific for the Falcon (or any Atari computer) can be.

But with a chip like this you need very little more, so the hardware
cost can be kept way down.

>The important thing to us Atari fans is how fast it will be when emulating
>a 68030. It will probably still be pretty fast, especially if the 68030

Given that it starts out with a factor of a hundred or so (if running
at 266 MHz (I seem to recall the 16 MHz '030 being rated at below 4 MIPS))
higher speed, I think it's reasonable to assume that it will be pretty
fast even under emulation...

You could always ask someone with a recent Mac what kind of speed they
get under 68k emulation.

2965. PageStream user needs help

Newsgroup: comp.sys.atari.st
Date: 1999-05-16 00:00:00 UTC
From: marlin@mail.icongrp.com
Message-ID: <7hmnke$qm8$1@nnrp1.deja.com>
Source record: 78680

I'm disappointed with SoftLogic. I was under the impression that they were going to write PageStream for the IBM platform, but I've never been able to find it. Is there a program for WIN95 that does what PageStream does on the Atari ST? Hopefully something with a small learning curve. If there is, does anyone have a utility program that can convert PageStream files to that program?

2966. Help with LG 520si and Videlity

Newsgroup: comp.sys.atari.st
Date: 1999-05-16 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <3sB%2.773$u3.313120256@momma.bigmomma.com>
Source record: 78681

I've been having some problems with my server here, so pardon me if I bring this up again...

About a few days ago, I bought myself a brand-new SVGA monitor for my Falcon, a 15" digitally controlled one made by LG Electronics of Denver, Colorado. And for the most part it's worked great, except:

I can't get a hi-res TrueColour screen under Videlity.

I'm currently typing this under a beautifully clear 800x608 16-colour screen with Videlity. However, I can't get it to boot up in HiRes TrueColour (which I was able to do with my previous Hyundai non-digital SVGA) - it boots up, but then the screen goes black and the amber Energy Star light goes on.

I HAVE been able to boot up in HiRes TrueColour with the HRTC.PRG program included with Nemesis, however, that's only in 640x480 and I would like to have the extra pixels (it's the resolution I use for web surfing with CAB).

If anyone can give me some help here if you've run into the same problem it'd be greatly appreciated. Here's some specs I've gotten on the monitor from the LG website (www.lge.ca) if this will help:

LG Electronics Canada, Inc. - Monitors and Optical

520Si
15"(13.8" VIS) High-Resolution Color Monitor

Designed for general business applications, the 520Si delivers sharper, crisper pictures and comes with a range of advanced features, including on-screen digital microprocessor controls, special screen coating, high-resolution, and high-refreshrates. For real performance at a more affordable price,it&#65533;s the 520Si from LG. Enjoy the view.

Well, I don't have a Sportster (Zoltrix) but I bet they are all very
much the same. Mine is 12v at 1000mA. The 1A load seems a bit high -
you could probably manage with half of that.

This is just fine for surfing.

>I have Mint and a cdrom running but the MiNT is a very early beta
>version.

Don't bother with this at the moment. MiNT is a cheap (but complicated)
way to get into multi-tasking. The less cheap (but more simple) way is
to use Magic.

>1) How do I get Web surfing going on this system? I am about to try
>Stik and cab but the docs don't make much sense to me. Help would be
>appreciated.

You will need to get hold of HSMODEM to sanitise the serial interface
- it's PD and widely available.

If you are using STiK you are limited to ISPs which support the SLIP
logon protocol.

Unless the Mega has been modified you will find that the serial port
has a max speed of 19200 - a bit limiting. The are commercial mods.
and a DIY mod which will double this.

The rest is fairly straightforward - you just fill in the blanks in
the set-up dialogues.

>4) What upgrades are available?

You don't need much for the set up you have. RAM above 4MB is tricky
to achieve. You could use a more modern HD driver such as CBHD or
HDDriver. In time you may need to add another SCSI HD or, perhaps, a
SCSI CD to the bus. If you don't already have one a mono monitor
(SM124/5 etc.) is nice.

I wonder, David, ... whether you have a glitch in the logical
structure of the partition you are using. Perhaps there is a
doubly-mapped block which you keep picking up for small (cache) files.
Have a poke at it with an HD tool.

2970. Mega 4 ST ram utility

Newsgroup: comp.sys.atari.st
Date: 1999-05-16 00:00:00 UTC
From: Steve@mguk.enterprise-plc.com
Message-ID: <1drwq9r.1skaiyf1w7z5q8N@max01-011.enterprise.net>
Source record: 78685

I remember from years ago there being a tiny util to set the STs ram to a certain amount. This was usful for programs that didn't like STs with 4mb ram.

I remember this util from many many years ago, but can't find a copy on the internet. Any ideas?

Thanks.

I havn't removed any chips (they seem somewhat stuck in their anyway!),
but I've pressed down a few times on various bits n pieces. The dodgy
ram upgrade looks, erm, dodgy.. so I pressed down on this board too, I
then heard something sound like it was pressing back in (iyswim).

The Mega has been working for around 2 hours without problems! :)
I've used this time to convert many msa files on the Falcon onto DD
discs - ST Demos! The Whattaheck demo, Dark Side Of the Spoon, and so
on. Even got some games that I can't use on the Falcon, like Lemmings.

They all work now :-)

I'm after re-building my demo collection now that I've returned to Atari world :-)

I've already got Dark Side Of The Spoon (ULM), although it doesn't always work (dodgy msa file perhaps??), and I've got other demos like Life's A Bitch and Whattaheck, etc..

But I'm after msa files of The Cuddly Demos, Ultimate Demo, Superior Demo and the Union Demo.

Is there a web/ftp site out there that I can grab these from?

2975. Sting dialer

Newsgroup: comp.sys.atari.st
Date: 1999-05-16 00:00:00 UTC
From: tparrett@fast.co.za
Message-ID: <926875480.113994@news.netactive.co.za>
Source record: 78690

I recently installed Sting 1.20. Before doing so I renamed my
Sting 1.15 set up in order not to lose the settings just in case there
were problems with the installation of 1.20
I managed to get 1.20 working OK but have noticed a problem with
the Dialer in that even when I have disconnected the modem via the Sting
Dialer dialog, when I next boot up and call up the Dialer it recognizes
the modem as being online even when it isn't. It will do this even if the
modem is not even switched on. If I then use the Dialer dialog to
disconnect the modem and exit the Dialer and then recall it in the same
session it will recognize the modem as being offline but if I reboot and
then call up the dialer it will again indicate that the modem is online.
Any thoughts on what I have set incorrectly. Unfortunatley my saving of
the Sting 1.15 set was faulty as although it is still working OK I'm
getting the same problem as above and it definately wasn't like that
before i installed Sting 1.20

You have the modem serial port marked as active in the "STinG Port
Setup" cpx.

Cure: Deactivate the port and save.

When you click on "Connect" in the dialer the port will be activated by
the dialer.

2979. STinG upload improvement 'tweak'

Newsgroup: comp.sys.atari.st
Date: 1999-05-16 00:00:00 UTC
From: dlanor@oden.se
Message-ID: <373df8b2211f160@oden.se>
Source record: 78694

Hi Guys,

I've now experimented extensively (for appx 30 Hours) with various STinG tweaks and improvements. I found that one control has a strong effect on the TCP upload speed, and is probably responsible for the low speeds some of you have had. Partially responsible I should say, because it is also very much due to slowness in ISP responses.

The DEF_RTT setting, with a default value of 200 ms, is intended to give the ISP side to 'shake hands' (ie: extend TCP window) befor the STinG side starts retransmission of already sent blocks. Many providers can not respond that fast, so the connection congests, using the majority of the bandwidth for retransmissions.

Raising the value to 500 ms should solve the problems for most of you, though some of you may have need of a *slightly* higher settind, since some ISP's do not use very 'straight' routing from modem pool to servers. That increases 'latency' which demands a higher DEF_RTT.

Do not raise it too high though, as that also increases the time it will take to recover after damaged packets. I advice a value less than 800 ms.

> my Falcon, but on my MegaST had features lacking on PhotoLine 2.3

I'm surprised to see Cranach for sale. I'll venture a guess and say that Woller acquired some old inventory, because the program hasn't progressed since 1993. Some components of Cranach never made it to PhotoLine, though, because there were legal battles with the programming team (the rights to the code going in different directions). At least this is my understanding -- their similarities confirms this for me. Their interfaces are so different but in many cases the code underneath isn't. At one time I tried to illicit a response from Gerhard Huber about the similarities of the two programs, but it didn't work :-)

Cranach has some features that PhotoLine doesn't (and vice versa). For those without video cards, I would recommend Cranach because of its handy 'Display TT Optimum', which allows 256-color previewing in TT Medium resolution (somehow it kicks into TT Low and then returns). Also, Cranach is better for halftone work.

I'm glad it's still available commercially, but be warned the early Cranach demo (http://www3.bc.sympatico.ca/roughley/tms.htm) doesn't do the program justice when compared to later versions.

2983. CAB 2.7 printing problem

Newsgroup: comp.sys.atari.st
Date: 1999-05-17 00:00:00 UTC
From: dkendall@facstaff.wisc.edu
Message-ID: <7hnr2b$q66$1@news.doit.wisc.edu>
Source record: 78604

I've had CAB 2.7 for about a month now and currently have the following problem: when I attempt to print either a web document or a local HTML file, CAB pops up a box saying: STOP--Printer Not Responding.

I have a dim recollection that I have printed successfully from this version of CAB, but I may be mistaken.

However, I can print the same pages from CAB 2.0 on the same machine. (Only difference is they're on different partitions.)

The setup is as follows: Atari 520ST, TOS 1.4, 2.5 megs RAM, ICD AdSCSI hard drive adapter, NVDI 4, STinG 1.12, CAB2.7, HP Deskjet 500 printer.

Seems to me I've seen similar problems mentioned here a few months ago.

Any and all help welcomed! Aside from this problem (and the fact that some of the extra modules don't seem to work), CAB 2.7 seems to be a good browser.

Thanks in advance,

Doug Kendall

2984. TAF meeting May 19th - Emulation, Elections!

Newsgroup: comp.sys.atari.st
Date: 1999-05-17 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <tzL%2.1000$u3.443804672@momma.bigmomma.com>
Source record: 78605

Agenda for the May 19th, 1999 Toronto Atari Federation meeting:

First, it's time once again for the annual TAF Executive Elections! If you like what the club is doing, or want to see a change in how it's being run, then by all means come in and let your voice be heard! This is the executive you'll be bringing in to the next millenium....

Then, we'll be looking at how to improve the efficiency of your PC computer - by installing an Atari emulator and running your favorite ST applications on it! We'll be looking at GEMulator, TOSBox, PacifiST and other popular ST emulators, running on both a PC laptop and on our PHOENIX editor's PC tower! Learn about how well the various emulators run, the advantages, the pitfalls, the issues on emulation - and what does and doesn't run. Needless to say, this seminar will also allow you to run your programs well into the millenium as well.

It'll be an exciting night, to say the least. See you there!

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. Membership in TAF IS Atari support!

Atari's RAM boards didn't use SIMMs, you had to change the whole board
to upgrade from 1 to 4 or to 4 to 14Mb.

If you are using a 3rd party board, then please tell us what board it
is, as there were quite a few of different kinds around. Most of them
take a 16Mb 72pin EDO or non-EDO SIMM, depending on the make or model.

Check out the Quick FAQ.

You have the choice between STinG (mainly for SingleTOS, but also runs
with MiNT), or MiNTnet (unix-like networking extensions for MiNT).

You'll find the latest MiNT stuff on ftp.funet.fi.

Don't get your hopes too high for Web surfing on an ST though,
especially if you don't have a hard drive. You'll get best results in
monochrome with graphics off. Mail and news is ok though, but a hard
drive makes things much more comfortable.

>
> 2) I have a line on a version of Linux which will run on the 68000.
> Anyone have more info on this?

I wouldn't consider this. MiNT is much more appropriate and better
supported on the Atari platform.

> 3) Can I network this machine other than via serial line?

Not really. There are no Ethernet adapters available if that's what
you're after. Both STinG and MiNTnet handle serial networks though.

> 4) What upgrades are available?

RAM boards, CPU upgrades, HD floppy drives, hard drive, TOS, erm...

2988. FS/T: Atari ST games [05/17/1999]

Newsgroup: comp.sys.atari.st
Date: 1999-05-17 00:00:00 UTC
From: VideoGameAdvantage@DittosRush.com
Message-ID: <375dca5c.23423339@news.nls.net>
Source record: 78609

All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 05/10/1999

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site. Unfortunately, none are for the Atari ST computers,
at this time...

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari ST computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection is currently on-line! Unfortunately, there is no
list for this system (cartridge and CD based systems only).

I have the following Atari ST software for sale or trade.

Unless specified, all items are *NEW* and are still shrinkwrapped.

SOFTWARE:

ATARI ST COMPUTER:

New diskette(s) [still shrinkwrapped! Includes box and manual]:
$ 7.00 Advanced Dungeons & Dragons: Heroes of the Lance (SSI)
$ 7.00 Alcon (Taito)
$ 7.00 All Aboard! (Terrific Software)
$ 7.00 Arkanoid (Taito)
$ 4.00 Art & Film Director (Epyx) -- $4.30 shipping, due to
weight, counts as 1st item
$ 6.00 Art Library 2 (Melody Hall) -- RIPPED SHRINKWRAP!
$ 7.00 Auto Duel (Origin Systems)
$ 7.00 Awesome (Psygnosis)
$ 7.00 Battleship (Epyx)
$ 6.00 BCPL Compiler (MetaComCo) -- RIPPED SHRINKWRAP!
$ 7.00 Blockout (California Dreams)
$ 7.00 Bobo (Terrific Software)
$ 9.00 Bride of the Robot (Free Spirit) -- ADULT content!

$ 8.00 Bubble Bobble (Taito)
$ 3.00 California Games (Epyx)
$ 7.00 Championship Wrestling (Epyx)
$ 7.00 Crash Garrett (Metal Hurlant)
$ 6.00 Cyber Print (Antic Software) -- NO SHRINKWRAP!
$ 3.00 Death Sword (Epyx)
$ 2.00 Devon Aire in The Hidden Diamond Caper (Epyx)
$ 7.00 Dive Bomber (Epyx)
$ 2.00 Dragon Scape (Free Spirit)
$ 7.00 Dynasty Wars (Capcom)
$ 7.00 East vs. West Berlin 1948 (Time Warp)
$ 7.00 Eliminator (Hewson)
$ 7.00 Emperor of the Mines (Impressions)
$ 2.00 Final Assault (Epyx)
$ 7.00 Forecaster III (Greg Kopchak)
$ 3.00 GFL Championship Football (Gamestar)
$ 7.00 Golden Path (Firebird)
$ 7.00 Goldrunner II (Microdeal)
$ 7.00 Hoyle Official Book of Games (Sierra)
$ 7.00 Hyperdome (Exocet)
$ 7.00 Impossible Mission 2 (Epyx)
$ 7.00 Jewels of Darkness (Firebird)
$ 7.00 Jupiter Probe (Microdeal)
$ 7.00 Karateka (Br0derbund)
$ 7.00 Keith Van Eron's Pro Soccer (Microplay)
$ 7.00 Knight Orc (Rainbird)
$ 7.00 L.E.D. Storm (Capcom)
$ 2.00 Lands of Havoc (Antic Software)
$ 7.00 Last Duel (Capcom)
$ 7.00 Leander (Psygnosis)
$ 7.00 Major Motion (MichTron)
$ 7.00 Man Hunter: New York (Sierra)
$ 7.00 Man Hunter 2: San Francisco (Sierra)
$ 2.00 Mean 18 Famous Course Disk Volume II (Accolade)
$ 3.00 Metro Cross (U.S. Gold / Epyx)
$ 7.00 Moebius (Origin Systems)
$ 3.00 Paint Pro (Abacus Software)
$ 7.00 Phantasm (Exocet)
$ 9.00 Planet of Lust (Free Spirit) -- ADULT content!
$ 7.00 Police Quest 2 (Sierra)
$ 7.00 Powerstone / Elf Lord's Magic (Starsoft)
$ 2.00 Prime Time (First Row)
$ 7.00 Professor Craps (Scorpio Systems)
$ 7.00 Project Neptune (Epyx)
$ 3.00 Quadralien (Spinnaker)
$ 7.00 Rambo III (Taito)
$ 7.00 Red Lightning (SSI)
$ 3.00 Renegade (Taito)
$ 7.00 Rick Dangerous (Microplay)
$ 7.00 RVF Honda (Microplay)

$ 7.00 S.D.I. (Cinemaware)
$ 7.00 Savage (Microplay)
$ 7.00 Silicon Dreams (Firebird)
$ 6.00 Slayer (Hewson) -- NO SHRINKWRAP!
$ 7.00 Space Quest I (Sierra)
$ 7.00 Space School Simulator (CRL Group)
$ 7.00 Star Quake (Terrific Software)
$ 7.00 Star Wars (Br0derbund)
$ 7.00 Starglider (Rainbird)
$ 7.00 StarRay (Logotron Recreation)
$ 7.00 Stationfall (Infocom)
$ 7.00 Stunt Track Racer (Microplay)
$ 2.00 SwiftaR (Accustar)
$ 3.00 Techno Cop (U.S. Gold / Epyx)
$ 7.00 The Advanced OCP Art Studio (Rainbird)
$ 7.00 The Colonel's Bequest (Sierra)
$ 7.00 The Games (Epyx)
$ 7.00 The Guild of Thieves (Rainbird)
$ 7.00 The Pawn (Rainbird)
$ 7.00 The Sentry (Firebird)
$ 7.00 The Viking Child, Prophecy 1 (Imagitec)
$ 6.00 Tower Toppler (Epyx) -- NO SHRINKWRAP!
$ 7.00 Transputor (CRL Group)
$ 6.00 True BASIC (True Basic Inc.) -- NO SHRINKWRAP!
$ 7.00 Typhoon Thompson: Search for the Sea Child (Br0derbund)
$ 4.00 Warship (Strategic Simulations, Inc.)
$ 3.00 Winter Games (Epyx)
$ 7.00 Wishbringer (Infocom)
$ 7.00 Wizard's Crown (SSI)
$ 3.00 World Games (Epyx)
$ 3.00 World Karate Championship (Epyx)
$ 7.00 Zero Gravity (Microdeal)
$ 7.00 Zork I (Infocom)
$ 7.00 Zynaps (Hewson)

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.20 for the first game and $1.10 for each additional game. Shipping for hardware and accessories depends on the distance that the order must travel. Foreign orders welcome.

Large orders will be weighed as a package, to reduce shipping costs.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very

rarely sell items that aren't working, but if I do, they are
clearly labeled as such.

3) Trade offers, in particular for items that I need, will be
considered (especially if the trade offer overwhelms me). I
collect for over 50 different systems, so please feel free
to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping
costs. Shipping cost depends on both the weight of the order
and the distance that the order must travel, unless a set
amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't
serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly
listed. There is no minimum order.

7) If you have a problem with the listed price, please remember
that nobody is forcing you to buy from me. I have been in
business since 09/05/93, so I have a good idea how to price
items. My personal philosophy is that something is only worth
what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order
-drawn from a U.S. bank branch-, or cash. Orders from outside
the U.S. are also accepted (also, please check out my want
lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your
order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in
(please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this
information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

Hi Ronald,

I think you just hit a nail on its head: I recall the default setting was 50, as Neil just mentioned.
Quite some months ago we had this upgrade for Sting from Peter, where several, but not all users noted an enormous drop in speed: I went back from the regular 1600 to 250 or so. This turned out to be the TCP module, by replacing it by an older one things went fine again. Peter did some experimenting on that one, I got 3 different "bugfixes" from him which all suffered from the same problem. In the end I never heard anything more on the matter, except for some users complaining about the same stuff.

So up till v.1.15 I used the old TCP module. Then I upgraded to 1.20 (and to a new modem) and I had good speeds, except for Newswatch and Popwatch. Turned the logging for them to off and the speeds were acceptable: good links to my ISP gave me around 1600 cps for Newswatch and Popwatch.

At the same time I set Spawner up to run them simultaneously.

Then comes your message about tweaking the DEF_RTT setting, next I see Neil trying it out and discovering the "low upload cps-rate" of aFTP disappearing, so I decided to increase my setting from 50 to tenfold.

Ran another batch to my ISP, 8 emails coming in where the cps-rate displayed soared to 2750 at times, at the same time Newswatch was fetching articles but since the box is covered by the Popwatch box I didn't see the cps rates for Newswatch... All the emails were small ones (2000-3500 bytes), so I figure on longer ones the cps-rate will go over those figs.

Anyway, I'd recommend to anyone still using this default value of 50 to at least shove it up to 200 or higher.

The strange part is: obviously it didn't affect cps-rates on CAB, Newsie
and *downloading* with aFTP...

Try TOSBOX, which has better emulation for serious apps, and allows
larger screen resolutions with a TOS 2.06 image.

Using the PC's floppy drive is risky business with any emulator, so I
would forget it.

It might be easier to use the STE with Ghostlink (see the Quick FAQ) and
Diamond Back to transfer the files over. Ghostlink is slow (it uses a
serial null-modem connection), but as this will be a one-go operation,
that should be acceptable.

Tried Aniplayer ? I'm not sure, but it might do conversions. It should
be on ftp.lip6.fr somewhere.

> oh yeh. does ICD still exist? i'm using their Link2, but i wouldn't mind

You can use any driver. I would suggest HD Driver, since it's the most
modern/compatible/supported.

Thanks for advice but I've tried Gemulator, the only emulator I know
about, and wasn't satisfied. I would like to find a similar program
written directly for WIN95.

thanks, but while I have nVDI 4, it will not print to my HPLaserJetII.
The driver in nVDI is for a HPLaserJetIIp (which I assume means
Postscript)
and my HP is not a postscript. nVDI 5 prints OK (I tested it from the
TAF machine)
but O think it might be less expensive to get Speedo updated from 5.0b
to 5.0c
than to upgrade to nVDI 5.
although I will get nVDI 5 in the future.

unless I have made a mistake with the nVDI 4 HP driver that I have??

There was a recent thread in a Mac newsgroup about how much of Mac OS runs under emulation (less and less these days). My experience is that running under a 603e PowerPC processor, like the Titan will use, native PowerPC code makes quite a big difference in performance.

I did a number of benchmarks using the MagiCMac demo, comparing it to my TT. To get an idea about how much faster MagiC ran on a 603e, I used GrafTool to process large 24-bit scans down to 256 colors using the best dithering (FS) and palette mapping (octree complete), and then made notes of the processing times (in milliseconds) that GrafTool reports in its log. Running on a 300MHz 603e was about 12-15 times faster than the same conversions on a 32MHz TT. Only the time for the octree processing was used, disregarding the image load time and how long it took to get to the screen after the octree remapping was completed. The Mac has 60ns RAM, the TT 70ns.

I don't know whether this is indicative of the performance expected for the Titan board. In any case, it gave me an idea -- all variables considered -- about how much faster a 603e is under emulation compared to a 68030.

BTW, I did other benchmarks, too, like timing CAB to see how long it took to render a non-cached HTML page with nested tables and images (both GIF and JPEG). The difference in speed was close to that of GrafTool's.

What sort of info are you after ?

The most complete list of link I know of is Hallvard's Atari Launchpad:
http://launchpad.atari.org

If you are looking for free/shareware software, the Ultimate TOS
Software Index is for you:
http://utsi.atari.org

If you are more into 80's Atari nostalgia, the Little Green Desktop
http://lgd.atari.org

May I also suggest a look at the Quick FAQ, which should get you started
and more:
http://quickfaq.atari.org

That should keep you busy for a while!

I don't have details, but I'd warn you that it's possible that the "wall
wart" for the modem _might_ be AC, not DC output. This could seriously
damage any other piece of equipment you plug it into.

Can you not find matching equipment for the other PSUs you have and thus
eliminate them?

3001. Speech engines

Newsgroup: comp.sys.atari.st
Date: 1999-05-17 00:00:00 UTC
From: Simon Hazelgrove <simon@webprecinct.co.uk>
Message-ID: <926954256.27154.0.nnrp-06.c2deffda@news.demon.co.uk>
Source record: 78622
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I set up my atari again the other day - I remember speech engines that sounded quite cool in a retro way (they do now anyway - I remeber being amazed when a computer spoke!). I want to use some samples of this speech in music I make (anyone remember that "Das Boot" track?)

Does anyone have any speech engines to distribute? If so, please email it to me, or point me to it, whatever!

Thanks for any help,

Simon H.

3002. Questions on Falcon030

Newsgroup: comp.sys.atari.st
Date: 1999-05-17 00:00:00 UTC
From: Steve Lugovsky <steve@hitec.com>
Message-ID: <926956716.727.27@news.remarQ.com>
Source record: 78623

Hey there, I just purchased a Falcon 030 for my Midi Studio, and as I'm only familiar with the ST/Mega line, had a few questions...

1)Where can I get a monitor for it? Is there a cable/adapter for use with current monitor products?

2)With the DSP of the Falcon, is it possible to do digital sound editing? If so, what is the best software released, and where can I obtain cables to connect the dsp to a digital device such as a DAT machine?

3)Is there an ST/mega/falcon (all you ever wanted to know) resource website out there for newbies such as myself?

4)What was is the best MIDI sequencing package available for the Falcon?

Forgive the ignorance...Any help would be greatly appreciated!

No problem, you'll find lots of help here.. ;-)

->1)Where can I get a monitor for it? Is there a cable/adapter for use with
->current monitor products?

Just about any modern VGA or SVGA monitor will do fine. You'll have to add some software (Centscreen, Videlity, Videl Inside, Blowup) if you want to take advantage of higher resolutions than 640 x 480 though. Older Atari ST monitors (SC1224, 1435, or the mono models) will work as well. Note that you need a monitor adaptor for whichever model (VGA or RGB) that you get... OR you can get a multisync monitor from an (gasp!) Amiga dealer, so that you can use just about any of the Falcons software. More expensive, but you won't run into problem software that way. (some software wants VGA only, some like games and demos want RGB only)... Its more expensive though...

->2)With the DSP of the Falcon, is it possible to do digital sound editing? If
->so, what is the best software released, and where can I obtain cables to
->connect the dsp to a digital device such as a DAT machine?

I'll let the music/audio experts help you here...

->3)Is there an ST/mega/falcon (all you ever wanted to know) resource website
->out there for newbies such as myself?

The "Do It Falcon" faq file is good...(cue a URL from Nick?) ;-)

->4)What was is the best MIDI sequencing package available for the Falcon?

Again, I'll let the music "guru's" answer this... ;-)

->Forgive the ignorance...Any help would be greatly appreciated!

No problem, glad to have you aboard! ;-)

HEllo

I've done the audio modifs on my falcon, but i'm not completely satisfied : i'm obliged to send maximal level from my mix to get a correct recording on the falcon

I've changed steinberg specifications for these modifs on only one point : r66 and r87 are given by steinberg to be changed from 100K to 47 K ; following some recommandations, I've changed them to 1.8K : wrong value it seems

So, what is the good one ?

regards,

> 1)Where can I get a monitor for it? Is there a cable/adapter for use with
> current monitor products?

It will work with any standard monitor, whether VGA, SVGA or RGB.
Cables are available from any Atari dealer (if you can find one!).

I have:
Sony Multiscan 15sf - standard SVGA multisync with fantastic
picture.
Phillips CM8833 - yes the old RGB model!

Note that the cables are different because one line on the
Falcon's monitor port detects whether you've got a VGA or RGB
monitor attached and gives you the correct resolutions. That line
is hardwired as appropriate in the relevant cable.

Microvitec 1438 - this is a SVGA multisync that syncs down to RGB
frequencies, not as good a picture as modern SVGA models but at
least you can then have the convenience of being able to access
all Falcon modes on the one monitor. Note that the cable has to
be a special one with a switch on it, to allow you to switch the
Falcon between VGA and RGB modes.

Also note, as pointed out by another answer, the default Falcon
resolutions are not that wonderful and you'll need some additional
hardware/software/accelerators to take advantage of them. What looks
interesting is that the UK-based Titan designs (now called Core
system I think) have just released a card that allows you to plug in
standard PC graphics cards.

hi
I have been trying to get Okami up and running, and have run into 2
(I think) problems.
1) When I run Okami it can't find batch.txt
Is POPwatch suppossed to create this?
2)Okami reports that the index for my mail is corrupted, and can it
fix it. well, Okami trys but it cannot fix it. I downloaded more mail and
tried again but the same result. Does anyone know of a way to recover
from a corrupted index file for Okami's mail?
the hyp file and docs don't mention how to get around this, although
they do mention that Okami will try to correct corrupted index files.
thanks for any help!
merci

The preffered spelling, according to the Oxford University Press (and others), is indeed -ize. -ise is accepted as a variant, but is not preferred. If anyone has an old OUP dictionary, I'd like to find out for how long this has been the case, because, unlike other words (colo(u)r, etc.) neither variant is described as an Americanization (Americanisation accepted, but non-preferred ;)

I've used the same drive on a Falcon, ST, Ste, Mega STe and STfm, using HD Driver and the ICD pro utils. On the STs I used an ICD Link II. It worked fine on all the systems, though I did have some problems when I tried to daisy chain it with a ZIP drive. Try the MO as the only item on the chain, if you can, to at least eliminate this as a possibility.

My drive came from a Mac dealer (and cost £600 at the time!) It's external, and I've used it with several IDs. It also has a "Mac/PC mode" switch, but it works with te Ataris on either setting.

Hope some of this helps.

3013. TAF Meeting May 19th - Elections, Emulations!

Newsgroup: comp.sys.atari.st
Date: 1999-05-17 00:00:00 UTC
From: "Daniel L. Dreibelbis" <dreibel@idirect.com>
Message-ID: <17051999142142739%dreibel@idirect.com>
Source record: 78634
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy,comp.sys.atari.announce,alt.atari,comp.sys.atari.programmer

Agenda for the May 19th, 1999 Toronto Atari Federation meeting:

First, it's time once again for the annual TAF Executive Elections! If you like what the club is doing, or want to see a change in how it's being run, then by all means come in and let your voice be heard! This is the executive you'll be bringing in to the next millenium....

Then, we'll be looking at how to improve the efficiency of your PC computer - by installing an Atari emulator and running your favorite ST applications on it! We'll be looking at GEMulator, TOSBox, PacifiST and other popular ST emulators, running on both a PC laptop and on our PHOENIX editor's PC tower! Learn about how well the various emulators run, the advantages, the pitfalls, the issues on emulation - and what does and doesn't run. Needless to say, this seminar will also allow you to run your programs well into the millenium as well.

It'll be an exciting night, to say the least. See you there!

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. Membership in TAF IS Atari support!

You can go grab "Talking message creator", it must be well over
5..maybe 6 or 7 years old.. but you can set a lot of the speech
configurations.. pitch and vol and tone and oooer.. and get it to talk
for hours..
http://web.ukonline.co.uk/accrington/stosser/ look under titles..

Beware...the program is very old..not exactly state of the art and one
of the first things I ever made.. so dont expect too much :)

Hallo Vassilis!

VP>Note that most (if not all) MagiC utilities (including the file
VP>selector), will NOT revert to Fsfirst if Dopendir() fails. For the
VP>moment BNET.APP/ACC alone (without the XFS) is not supporting
VP>the 'modern' calls (they are optional anyway). Maybe it explains some
VP>of your problems using this Falcon/Milan link.

Ah yes. Well, I just tried some more things. Presently, all three machines are linked together. On both Falcons, BNET.XFS and BNET.APP are active.

VP>Ok, both your Falcons are running MagiC, so you can make two full BNET
VP>installations (including the XFS).

Done. Using BNET version 2.06.

VP>Leaving the problem with screenblaster on your Falcon #1 for the
VP>moment (I'm sure you can live without it for a while, to help me find
VP>any bugs ;-),

No problem. As soon as I can access that machine from either one of the others, screen resolution is no longer _that_ important :-)

VP>have you a usable network between the Falcons or not ?

Well, to some extent: with Gemini, there are just some unusable drive Folders visible on both of the Falcons. *But*, as soon as I try opening the same drives/folders with magxdesk, both the other falcon and the milan suddenly are accessisble.
On the Milan, both Falcons are there even with Gemini as Desktop.

VP>Please check your HOSTS.INF file on the Falcon. Make sure it's on the
VP>same place as BNET.APP/ACC. Do you get an empty drive P:\ or is just
VP>the Milan entry missing ?

I did get an empty drive P: at that time, but the connection to Falcon #2 wath disabled then. I checked the HOSTS.INF right now, and it was correct. Enabled Falcon #2, too, and with the XFS active both other machines are there.

VP>I have to suggest to not use it until I make some tests, and maybe
VP>find a way to make it more MiNT friently.

I can avoid using it as I have ZIP drives installed in all three computers. These are much faster than any link I can install without having real network cards, but I have to change those ZIP disks...

I did another test right now, transferring my test file from Falcon #1 to #2. The copy program in charge was magxdesc respectively mgcopy, running on #2. IP

link is istablished via Midi ports. Transfer time was 2:32 minutes for 346795 bytes. No errors.

Transfer from Milan to Falcon #1, mgcopy running on Falcon #1. IP link established with 115k2 via Modem ports. Transfer time was 00:52 minutes for 346795 bytes. No errors.

Transfer from Falcon #1 to Milan. The copy program in charge was Gemini 1.A, running on the Milan. IP link established with 115k2 via Modem ports. Transfer time was 00:57 minutes for 346795 bytes. No errors. Ooops.

Oh, I have got to apologize, there seems to have been another error. The file used to test transfers was supposed to be identical on all three machines. But for some strange reason it wasn't, thus producing faulty error messages :-(

Now I distributed a new copy as a reference using the ZIP drives, and this time no more errors were found.

Transfer from Milan to Falcon #1. The copy program in charge was Gemini 1.A, running on the Milan. IP link established with 115k2 via Modem ports. Transfer time was 01:43 minutes for 346795 bytes. Still no errors.

And now for some more advanced exercises:
Transfer from Milan to Falcon #2 via #1. The copy program in charge was Gemini 1.A, running on the Milan. IP link established with 115k2 via Modem ports between Milan an #1 and via Midi ports between #1 and #2. Transfer time was 06:04 minutes for 346795 bytes. Very slow, but no errors.

Transfer from Falcon #2 to Milan via #1. The copy program in charge was mgcopy, running on #2. IP link established with 115k2 via Modem ports between Milan and #1 and via Midi ports between #1 and #2. Transfer time was 06:00 minutes for 346795 bytes. Very slow, but again: no errors.

VP>>Seventh, I shouldn't always start these sentences with "I" ;-)
VP>Maybe, but it's more acurate for bug reports ;-)

Well, I did this report, and I made the mistakes, so it's always me anyway...

During my tests today, I encountered numerous crashes of both falcons. These happened mostly as soon as the Midi connection was involved. Might be some buffer overflow due to missing handshake or the like, but is not really reproduceable. Both Falcons were up and running for over an hour now during most of the tests.
BNET is working flawlessly, though, although there is some trouble with Gemini under MagiC.
So, there is no need for more excessive testing under MiNT, as long as no other users will encounter problems.

Hallo Ronald!

RA>The XFS does not actually _do_ anything at first, except register
RA>itself to the MagiC kernel.

At that time it won't crash. But as soon as SB_AUTO.PRG tries to switch screen resolution, the system will be halted.

RA>There is probably some other cause for this problem, which apparently
RA>is 'triggered' by the presence of BNet.

That might be the case.

RA>That is why I suggested checking with different \AUTO\ and ACC setups.

Do you know the number of AUTOs and ACCs active on my machines? This would be a very odd job, especially with no really reproducable errors. Both Falcons were up and running for more than an hour this afternoon, so they wouldn't _always_ crash.

No, but NEWSwatch does. It's just a warning, nothing's wrong.

Try Ofind.ttp with option --Repi (and/or look for ofind.man).

Btw, is ther a Gem program to read MANs with text effects ? Or
alternatively a Tos one that could run in a vt52 window ?

Bye,
/Pascal/

I have the same problem on my Falcon. After installing Sting 1.15 I
suffered the massive drop in speed. Using an older tcp.stx cured it.

After reading Ronald's message I wondered whether altering the DEF_RTT
might allow me to use v1.20 at reasonable speeds.

Unfortunately it doesn't work for me.

Rich.

Well, what the heck. Take the gratitude anyway as our gift. <LOL>
Of course, you'll have to share it with Peter.

I did have the latest version of ExtenDOS, which I like a lot. It's
a teriffic program that does exactly what I wanted it to do...

Until one of the CPXs (I think) messed up something, and that made
ExtenDOS extremely unhappy.... but only under MagiC for some strange
reason. Under plain vanilla TOS, it was just fine.

I finally got tired of messing about with everything and got the docs
from your site, and followed the link to the latest version of SPIN.

I do still like ExtenDOS a bit more than SPIN, but SPIN works without
fail with MagiC. So I use SPIN under MagiC and ExtenDOS under TOS.
Best of both worlds, eh?

Have you looked at the bottom of the modem? Often the 'nameplate'
will tell you these. All you really need is voltage and current
(yes, milliAmps=mA=1/1000 ampere)

Hi Mr. Murray,

I'd really like to find a version of Diamond Edge that will work with
these large partitions. I have used version 1.10 faithfully on all my
hard drives for years and it has been rock solid. Only recently after
setting up 800+/900+ meg partitons have I ran into problems. IIRC, I
get a error with the bootsector on these large partitons.
If you don't mind, could you pass along the version Number of the
Diamond Edge software you are using so that I will know what to look
for?

ZORG is very nice also, Kellis pointed this one out to me and it gives
a wealth of info and lots of options. It works fine except for the
running out of Memory problem if I have a very large amount of
folders/files on a partition. I think the Docs state to install
Folder300 in the auto folder as a work around. But I didn't think
this was necessary on the Falcon.?
I did put folder300 in the auto folder and it still ran out of Memory
when scanning through the directory tree.

The VMF is working out great! Thanks very much. ;)

Hello,

I'm looking for MANY Jaguar games and I'm currently interested in
trading and/or purchasing them.

My most wanted at the moment would be:

CatBox
Memory Track
AVP
NBA Jam
Defender2000
I-WAR
MC3D
Just to name a few!

What do I have to trade?

Well, not exactly Jaguar stuff, but the following:
Atari 520ST
Apple IIgs with 5.25/3.25/color monitor, keyboard, no software.

For 2600:
California Games
Midnight Magic
Defender II
Thunderground,
Harbor Escape
Eggomania
Kung Fu Superkicks
Title Match Pro Wrestling
Snoopy and the Red Baron

2600 multi-game selector.

5200:
Rescue on Fractulus
Mario Bros.
Countermeasure
Kangaroo
(many many others!)

7800 system
7800 joysticks

Atari 8-bit 800 with ps, dd, td, some manuals...

Depending on what you have, possibly some Lynx games! =)

Please feel free to email all wants/sell/trade to Liberator@acsplus.com
or just contact me through ICQ! ---38352629 Nexar

Thanks,

Clint T.

I also have a LOT of other stuff at:

I have again checked the installation and do have the new version drivers
in place. Perhaps my download of the Sting archive is faulty. I'll try and
collect a new copy just in case. I thought the problem may be related to
the problems I was having with the dialer. I've now corrected that (thanks
to Kenneth Medden) but it hasn't made any difference.

Message-ID: <_Th03.19935$1N3.18325@nntpserver.swip.net>
Source record: 78553

Hi Steve,

> 1)Where can I get a monitor for it? Is there a cable/adapter for use with
> current monitor products?

A standard SVGA monitor suits perfectly, but even so, you need an adaptor - there isn't a monitor in the world that fits the connector without an adapter - not even Ataris own...

> 2)With the DSP of the Falcon, is it possible to do digital sound editing? If
> so, what is the best software released, and where can I obtain cables to
> connect the dsp to a digital device such as a DAT machine?

Sound editing can be made in several ways - it all depends on what you wish to do.
Some examples are: ZeroX, WaveMaster, AudioMaster, Dynamite, DeNoiser...
There are some titles around and the programmers don't accept bad sound quality, so you'll be safe... ;)
To connect the Falcon to a DAT, you'll need the S/Pdif interface, which has both coaxial and optical in and out.
Check out www.soundpool.com to see more about the various soft- and hardware and ask your local (?) dealer to get it for you.

> 3)Is there an ST/mega/falcon (all you ever wanted to know) resource website
> out there for newbies such as myself?

One of all the places to look is my own site, www.holmerup.com, where you'll find some info about how to get your Falcon to become a pro music machine, as well as have a chance to check my own studio out etc...

> 4)What was is the best MIDI sequencing package available for the Falcon?

Cubase Audio or Cubase Score - no doubt. Logic is also very good (the non-Audio version), but I've heard too many horror stories about people trying to get Logic Audio to work as it should, so I'd never recommend it (I feel a flame coming up from all the Logic users out there...). I would in fact be very happy to learn about Logic Audio systems that work as stable as Cubase Audio - so I can say that it actually is safe to use Logic Audio too - but I'm hard to convince since I've seen terrible examples with my own eyes - and after lots of problems, Cubase Audio has been tried on the same computer and everything started working like clockwork...

> Forgive the ignorance...Any help would be greatly appreciated!

The best way to learn about things is to ask - which you've proved here... ;)

Hi Alan,

> I've recently acquired a Mega ST2. It has a AA battery case on the
Hard
> Drive case as well as the CPU box. What are these for?

On the CPU box, the batteries are intended for the RTC, to keep the clock accurate when you turn the computer off. On the harddisk box - well, I suppose it was too expensive to make several different cases, so the battery compartment had to be there. It has no use on the HD box though...

This is back in the "early" days. Besides not only is the PPC Mac fast enough now, but hardly anything isn't PPC anyway.
For me, AppleScript was the only none-PPC part of the OS I hated. Even this is now native (at last!)

So how will the Atari Falcon be okay right from the start with a native PPC emulation then? A 266mhz PPC Falcon is very tempting :-)

From: dlormand@aztec.asu.edu
Message-ID: <7hsah8$66g$1@news.asu.edu>
Source record: 78556

I am wanting to generate GIFs or JPEGs to put in a video-titler presentation, with something like a digital camera or video camera as an input source. This video-titler puts Degas pictures up in ST Low Rez and I pipe the composite output to a video projector. So the most disturbing limitation is 16 colors. Oh, well.

My preference is to use a video camera (which I have) vs. a digital camera (which I don't want to pay for and which doesn't probably support any interface the ST has). Do I remember correctly about a gadget called "Computer Eyes" that would do frame capture, and save the frame in some suitable format?

Is this still around/available from someone (probably used)?
How well does it work? What formats does it save pictures in?

On a side note, I would be wanting to convert from whatever format the frame-capture system produces to .PC1 or .IFF. GEM-View does this. Is this the best tool for the job? Is Dieter Fiebelkorn still around (to take fairware contributions, say)?

<akw32@email.byu.edu> writes
>I've recently acquired a Mega ST2. It has a AA battery case on the Hard
>Drive case as well as the CPU box. What are these for?

I think they used the same case for the Mega STx series as well as the
SH205 hard drive. There's nothing in the hard drive that it can connext
to.

>Also, how do I tell which version of TOS it is running?

The model's I've come across have all been TOS 1.4 Rainbow TOS (or
1.04). IIRC 1.4 was the first one to support the blitter!

Anyway, if you go to the 'DESK' selection on the menu bar and look at
the copyright dates the following is what version they match.

I am doing this from memory, so please correct if I'm wrong;)

1985 = TOS 1.09 ROM based.
1986 = 1.2 (1.02)
above 1986 = 1.4 Rainbow (1.04)

From: tennent@mail.com
Message-ID: <7hskec$2pi$1@news7.svr.pol.co.uk>
Source record: 78561

Does anyone know what having 20 bombs across the screen means? I that the number of bombs you get denotes what sort of error it is, but I have long forgotten! It happens to me when I use Pacifist to play Championship Cricket from the Automation CD11 (or rather the disk image of it), and I go to play a County Championship game. Anyone else expirenced this and is there anyone who knows how to solve it?

Thanks

Kevin Tennent

I've got an old Atari 1040STF (no hard drive, just 3.5 floppies). I need to convert some old First Word + documents over to a DOS/Win95/98 PC format (pref. Word or RTF but text will do). The documents are all on ST formatted 720k (?) floppies.

How can I do this conversion? N.B. I am unfamilar with ST emulators, so please provide detail where necessary.

Thanks,

Sandy

I certainly do Louis. I renamed my existing Sting folder and unpacked
the v1.20 archive. I then copied the various script, auto and acc
files to the relevant places and rebooted.

>Funny, the slow-speed-problem didn't show here straight from the beginning.
>It was the first module that worked OK, after having been forced to use an
>old one with earlier upgrades.

From v1.15 I have had to use an older tcp.stx file.

Rich.

Hi

I'd like to thank all those whom responded to my frustrating problem, I have now sorted it out;)

I've enclosed an email I received from an Atarian, that doesn't look like it had been posted in the newsgroup. As I think it could possibly help someone else I've stuck it below: (continued after message)

<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<

On Tue, 18 May 1999 at 04:58:10 a message from Bob Poggioli was created on the subject of MO Optical drive Blues:((Still... More info!.
>
>Recently you wrote in comp.sys.atari.st:
>
>I don't know if this will help you with your problem but I have a
>couple of MO drives which are only recognized on my system (ICD Link2
>hardware and HD Driver software) if I set the SCSI ID to 5 and place
>them physically last in the SCSI chain (and, hence, I can only use one
>of them at a time). I do not know why they behave this way but,
>since they are old units, I suspect that their SCSI implementation is
>faulty.

<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<<

Well after spending the best part of 4 hours finding all the docs I could find on Fujitsu web site and messing around with dip switches, the above email got me thinking! So I thought I'd go through all the ID settings, starting at device ID 1; I needed my main hard drive connected, I couldn't be bothered to actually change it's ID.

Anyway, lo and behold using ID 1 the drive sprung to life!!! I didn't try any other ID setting; I'd already tried 2, 4, 5 & 6!

I found out that using HD Driver with the ID at 1, I got a more reliable response than my main drive! It also needed another drive attached, I don't know why as with jumpers set for 'power supplied by drive and host controller' it supplied the power to the Link II!

The drive can be set for it's own termination, with the jumper shorted, or with an external one. It also worked at the beginning of a chain as well as at the end.

Now I'm hoping that everything should be fine with the other devices; EZ drive and 3 x CD multi-changers.

Unbelievable that something so simple would cause a loss of my hairs on my head, what is left has gone grey;P

So if you have a SCSI drive that's not doing as it's told, my recommendation is as follows:

Try the drive on it's own, if it's can power the DMA-SCSI adaptor. If not you'll have to leave it a drive in-line, a little obvious:)

Go through all the ID numbers with a terminator, not forgetting to turn the device OFF when changing as the drives ID only gets updated when it's turned off and on. (on ALL drives I've had).

Still no success, try the above without a terminator.

Then try altering jumper settings, but be methodical. If you have the jumper settings don't do/set anything that's silly.

Lastly, try different cables or shorter cables. Not ALL cables are of the same quality. It may be unlikely that you would have 2 bad cables, but I did!

The idea is get the drive working, and then find out what stops it working!

To think I sold my PD drive as I had the exact same problem with that:((Well I'll put that down to experience.

I'm now a very happy chappy:))))))

Thanks again to all those that help make this possible;p

Have you actually tried this printer driver? The HP2p is not postscript;
the "p" stands for personal. HP delivered it as a consumer level, lower
cost version of the II. Try the HP2 driver, I believe it should work for
you.

I've never seen that problem using the same qed here. Make sure you have
the latest qed (v4.52) and that you set all the config lines for qed in
o.inf. Example:

# External Editor configuration:
editor=d:\utility\qed\qed.app <-- your path, here
editfmt=%f %leditwd=d:\utility\qed

Hope this helps,

Pat

True it is a -fast- chip, but will Tempest owners get 100% out
of the PPC chip when it will have to be in emulation mode. Mac
owners of PPC machines have reportedly moaned about how slow a
68k program runs under PPC emulation mode.

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

It does sound as tho' the monitor won't synch to the particular scan rates
that you have set for TruColor in the Videlity setup prog.

Try tweaking the various settings, I can get 704*528 on my less well-endowed
monitor without difficulty - but on the way I noted that there were certain
settings that required tweaks to persuade the monitor to actually display
the test pattern at all! (You've got the pixel clock on 25MHz and 1/4 size
pixels?)

>tweaks and improvements. I found that one control has a strong effect

Thanks for taking the time to try this stuff out, I'm afraid that I can't see any improvement (in aFTP1.52b) upload speed here tho' :-(

Pardon me for changing tack, but a week or so back there was a suggestion that some script difference between STinG and STiK (pardon me if I have that wrong) was responsible for causing Dan's cab.ovl to fail on the autosurf and background file downloading modules of CAB. Olivier's overlay worked fine. Was there any conclusion reached on this?

> current monitor products?

You can use either an ST monitor (colour or mono) or a standard VGA
screen. In both cases you need an adapter, which can be easily home
built if you're not afraid of soldering connectors. There are schematics
in the Quick FAQ.

>
> 2)With the DSP of the Falcon, is it possible to do digital sound editing? If
> so, what is the best software released, and where can I obtain cables to
> connect the dsp to a digital device such as a DAT machine?

Yes, you can do all kinds of sound manipulation with the DSP. There is
lots of stuff out there. Have a look at http://www.soundpool.de or the
program Zero X.

Soundpool also sell DAT and SPDIF interfaces, and all kinds of expensive
electronic gizmos for the Falcon.

> 3)Is there an ST/mega/falcon (all you ever wanted to know) resource website
> out there for newbies such as myself?

The Atari ST Quick FAQ: http://quickfaq.atari.org

>
> 4)What was is the best MIDI sequencing package available for the Falcon?

Depending on who you ask, it'll be either Cubase or Notator/Logic.

The Audio versions of these programs allow you to mix MIDI and Audio
tracks (for guitar, vocals, etc...). Cubase Audio Falcon remains an
industry standard.

Avoid any cracked copies you might come across like the plague. They are
not stable enough to work with more than 5 minutes.

> Forgive the ignorance...Any help would be greatly appreciated!

Once you've asked the question, you're no longer ignorant.

Hi Mr. Phantomm,

I have Diamand Edge. After reading your posting, I tried doing a "defragmantation" on a 810meg partition on my 1gig Toshiba IDE drive on my 14meg Falcon using TOS 4.04. It worked fine. The partition was quite fragmented. No problems. I believe I've also used it on a (1gig) SCSI partition for audio. I think you'll have to find a used version of this program, as the company no longer supports Atari, (or even exists?). But some dealers may still have a new copy. I hope you find something that works well for you.

Howz the VMF working out? ;-)

3069. MPEG 1&2 Video decoder

Newsgroup: comp.sys.atari.st
Date: 1999-05-18 00:00:00 UTC
From: LE COAT Francois <lecoat@ief.u-psud.fr>
Message-ID: <37413805.B98C4FAE@ief.u-psud.fr>
Source record: 78587
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer,comp.sys.atari.st.tech

Hi,

I have adapted MPEG2DECODE, a bitstream ISO video 1&2 decoder, to all
ATARI platforms running more or equal to 256 colors. The decoder's
binaries are available at http://eureka.atari.org/mpeg2dec.zip
It works now nicely. But, I was wondering whether someone would be
able to extend the C source code, so that it could decode MPEG
audio included in the stream. I've no idea of what to do, but maybe
someone would do it. The sources have been succesfully compiled
with PURE C 1.1 and GCC 2.8.1 in 16 and 32 bits int modes. There's
more and more MPEG sequence on CDROMs nowadays, and decode them
without the sound is a bit frustrating. Of course there's a need
of CPU power to decode MPEG, but I have an HADES 060, and powerfull
ATARI computers now apear. I think that to decode both Video and Audio,
Audio should be preprocessed, and be played while decoding Video.
I've no idea of MPEG Audio formats, either than the audio stream
included in video, but, my decoder decodes MPEG Audio/Video 1&2
streams without the sound for the moment. If anyone has the ability
to adapt my C sources, I would be glad to send them. Maybe
I could take advantage of MPEG Audio decoders that are available
on ATARI.
Thanks for cooperating ...

Regards,
Bye for now,

Uh? Hmm I can't get it to make any sence of my 800MB partitions. :)
(Negative number of free/used bytes, finds disastrous errors when it
tries to check, and this was on a cleanly formatted drive.) :)

> partition for audio. I think you'll have to find a used version of this

I had 2.01 and found a patcher to upgrade it to 2.04, it's on
ftp.funet.fi. But since yours recognises bigger partitions, I assume you
have a higher version? :) Might be a downloadable upgrade for it too.

Maurits.

Hi Richard,

you do use the newest TCP.STX that came with Sting 1.20, do you?
Funny, the slow-speed-problem didn't show here straight from the beginning.
It was the first module that worked OK, after having been forced to use an
old one with earlier upgrades. The new DEF_RTT setting thusfar only
influenced the speed for Popwatch here, haven't checked aFTP yet...

Hello everyone,
since a couple of days I'm a registred user of version 2 of Okami.
The program works wonderfull but there's one strange problem. When
I'm trying to write a message or a reply Okami calls the editor. QED
appears with a new window but the mouse-arrow has disappaered. It
returns nicely after quitting the editor with alt-Q and re-entering
Okami. I also tried Everest as editor but that didn't make any
difference. My computer is a Falcon with Magic 5.04 and NVDI 4.11.
Does anyone have similar experiences or a suggestion? I'd appreciate
it.
Regards, Joost.

DAVID L. ORMAND (dlormand@aztec.asu.edu) wrote:
<edited>
: I am wanting to generate GIFs or JPEGs to put in a video-titler
: presentation, with something like a digital camera or video camera
: as an input source.
GIFs or JPEGs? see next comment.

: This video-titler puts Degas pictures up in ST Low Rez and I pipe the
: composite output to a video projector. So the most disturbing limitation
: is 16 colors. Oh, well.

see if VideoMaster is still available. on an ST it'll do grey-scale capture til you run out of RAM (i think 4Meg memory gave me about 400 frames or so at 160x100). if you want stills only you can use the full-screen mode and save in 16 or 512 colour. it had an extended palette mode as well, if i remember correctly. Degas, Neo, IFF, Spectrum formats supported. can't recall if 16 colour GIF was also an option.

there's also a VideoMaster made for Falcon, which i've not used, but i believe had better resolution and colour settings.

: On a side note, I would be wanting to convert from whatever format
: the frame-capture system produces to .PC1 or .IFF. GEM-View does
: this. Is this the best tool for the job? Is Dieter Fiebelkorn still
: around (to take fairware contributions, say)?

well, the conversion is unneccessary if you get VideoMaster. if you get something else, i find ImageCopy (i've got v3.5) with it's batch processing and dither-options to be a very useful tool. GEM-View was it's main competitor back then, so it seems likely that it must be on a par with ImageCopy for options, etc...

if you're working in 16 colour mode, i'd suggest you find CyberPaint and use it's compositing features. Prism Paint also can be useful, and it was a giveaway on an ST Format diskette. #48 i believe. but it sucks compared to CyberPaint, trust me. nothing in my experience came close to CP for animation, compositing, and image manipulation on the ST. too bad they never made the port to Falcon like was rumoured a few years ago...

if you REALLY want to get fancy, get a Video deck with a good pause option (no blur), then sample each frame into VideoMaster as a Spectrum image, save off each frame in it's RGB components as a Degas file. do a manipulation of each component in CyberPaint (CP lets you save certain data transformation configurations), then re-load the three files back into VideoMaster. it takes a bit of practise to learn what you can and can't do (DON'T change the palette info or you're toast, etc), but the

results are pretty out there. you end up with pretty bizarre looking Spectrum files, which can be merged into a 512 colour animation using SPCtoSPS.PRG (a program by John Stanford).

word of warning. yes, this is very cool to achieve on a sixteen colour ST, but you pay the price in time. each frame you capture in VideoMaster at 512 colours will take about, oh, 30 seconds to save.
-saving the RGB components will take another thirty seconds.
-loading each frame into CyberPaint will take 4 or 5 keystrokes/seconds.
-saving off each frame FROM CyberPaint...ditto.
-reloading each RGB component will take... you get the idea right?

if i could find a program that built DLT's from Degas files, and also could break DLT's into individual Degas files, i'd be a lot happier. so would my girlfriend... i had actually found a TTP that was supposed to do something like this, but it never worked properly for me. maybe it didn't like the fact i had an STe, or maybe it was TOS1.62; i dunno...

actually, if you have access to a Falcon, Black Scorpion had a thing going with a REALLY nice animation program, can't recall the name. it was supposed to have a video hardware made (or being made) for it. i never got a Falcon, so i don't know what happened to that one. sounded very cool tho.

well, that was a lot of babble. hope some of it was useful.

Source record: 78449

Hi. I've just picked up a null-modem cable from a PC-owning friend (he supports Linux, so I can tolerate him!), and I'm attempting to use it with a TT and a Mega ST. Its got female connections on both ends, (25 pins) so it plugs right into the Mega ST and I'm using a pass-through 25 pin to 9 pin adaptor for the TT. Now...I fired up both machines, and the Mega ST is the one that runs DarkForce (my BBS), using BBS Express! ST v1.98a while the TT has both CoNnect (GEM) and Minicom v1.71 (MiNT) on it. Well, I tried calling with both of the comms programs on the TT, but nothing happens. Minicom won't let me do an "ATDT number" on its screen, won't accept any keyboard input. Ditto with CoNnect under GEM. If I try to dial from CoNnect using the dialer, it tells me that "this window is already connected to a host". I did also try booting up one machine, then the other, and vice-versa. This made no difference either...Does anyone know if BBS Express! ST is capable of recognizing an incoming signal from a null-modem cable? Hmm...

So...my question(s) are: do I need to do something else to get these 2 machines to communicate with each other-or am I simply doing something wrong as is?

BTW: using CoNnect and Minicom with a regular modem works just fine, so its not the port or the programs as they are now.

Thanks in advance... ;-)

Hi Bob,

I'm not so sure: imagine Gates had been christened Tramiel, wouldn't we have had TOS 1.00 with an enormous amount of patches, totalling up to 250 Mb where one wouldn't even guess where all the different files are for or even are located, what they do etc...??

Then, there still are marvels: take Papyrus. Right, for an Atarian it's big, around 4.3 megs without the dictionaries. (I'm talking about the 7.02 demo I'm still running). Compare this to Word-97... Then take a "document" for Word, write 2 lines full of text (one font, average size), save it and you'll have a file of 20 kB. Do the same in Papyrus and the file is maybe 1 k.
Papyrus is out for Win-95, OS/2 and Mac as well, is getting popular and is very limited in size there too...
I can create Word-docs with it (RTF style), take it to the box at work, load it in Word and only the graphics need some re-setting.

One of the positive sides of this whole Win/Gates stuff is it made components for US cheaper too :-)

There still are programming marvels for us Atarians...

Check out my page on the subject at:

http://www.whalley.demon.co.uk/atari/texts/wp_help.html

This includes RTF options, but omits the Marcel word processor, which will
also import 1WP and export RTF, I believe (*thinks* must do an update
soon...).

Hi Ronald,

I doubt I'll ever reach one-tenth of that... Up till now: zip-nada-nothing reactions. Okay, I haven't got much available right now, since I'm pretty unsure about exactly what to put up there. Don't wanna start real competition with others. For a real extensive support BBS I haven't got the HD space plus I want to keep it small. Rite now I put up some Internet stuff, the Matrix stuff that is also available from my homepage and a few piccies (just for the fun of it).
I've been asking before, if people have suggestions, they're welcome.
Rite now anyone can login as Guest, have 20 mins access time and a 5 megs free D/L. Once registered the level moves up to 30 mins access time automatically.
Again, time will tell. As long as my system runs 24 hrs/day, I can leave the BBS stuff on as well, doesn't harm...

|I've recently acquired a Mega ST2. It has a AA battery case on the Hard
|Drive case as well as the CPU box. What are these for?
|Also, how do I tell which version of TOS it is running?

The original Mega had a hardware clock with the battery under a
cover in the top, back, lefthand corner. It did not come with a hard
drive as standard. The Mega STe did. The TT which uses a similar
case (different colour) had a lithium clock backup battery under the
cover for the hard drive. The Mega STe might have the same.

| . . . .

The 'p' stands for personal as far as I know. It tends to be a slightly less robust version of the non-p printer. I am using a LJ5p now but have used a LJ4p and LJ3p with Papyrus and NVDI with no problems. I wonder if there was a change in the language after the 2p? But even if there was, if you have the appropriate driver it should work. Are you working in colour? There is something about printing while in a colour mode which rings a bell. The other thing is that Papyrus has its own drivers for the printers and these are preferable to NVDI's as they are faster. I only use NVDI with Papyrus to get the fonts. Try experimenting with the settings - I forget which menu they are under - possibly Compatability (but note the warnings!).

Ron,

Congrats on your BBS milestone!! I can appreciate your enthusiasm. I
just took my ToadHall BBS down after almost 12 years of non-stop operation.
It was difficult to do; and I postponed doing so for a very long time,
but the activity was negligible. People changed platforms and the internet
stole away users. It just wasn't worth maintaining any longer, unfortunately.
Good luck with your!!

Try setting the name in lowercase, eg editor=c:\qed\qed.app, this will
probably fix your problem. As it says in O.INF "case is significant",
ie UPPERCASE results in pexec() (no mouse under multitasking ;-),
lowercase results in shell_write().

I have tried experimenting, there are basically no setting s to
experiment with though.
the HP LJII is a b/w printer so colour is not the problem.
and P stands for postscript afaik, as you can install a postscript
module in the printer if you want.
maybe it has something to do with memory, perhaps i need more printer
memory, as I have problems with Pagestream printing out half pages.
thanks.merci

If thats the colour one that works on an ST and STe like the Philips 8833
then the answer is no unless you intend to use CGA or an EGA card that runs
on a CGS monitor. No modern operating systems (ie above windows 3.11)
support these resolutions. John.

The battery compartment on the hard drive doesn't do anything. On the
main unit (CPU box), it powers a RTC (Real Time Clock) that's on the
Mega's motherboard. 2 x AA batteries, well my ST4 is anyway.

Yes there is Strip Poker, Strip Poker Deluxe and there was an Othello
one called Centre Squares. There are a few more, but I can't recall them
at the moment.

<snippety, snip - card games>

There is a great package that allows you to choose computer opponents,
Hoyles book of cards. I can't remember which volume does poker, etc. and
which one is dedicated to patience card games.

As far as I know they only did 2 packages, vol. 1 & vol. 2! And was
published by Sierra online, and IIRC allowed use of a midi device for
the music!

Speaking of "adult games", I remember a few years back, Me and a friend
downloaded this game .. I have no clue from where I got it, And I didnt
know what it was when I grabbed it.. but, the graphics were excellent and
over all the game was very entertaining... now, the thing is, the whole
game was about, well.. you played the part of a walking penis! Has anyone
ever played this game?? Though it sounds sick, it was a fun game..

It was an ST game and ran in ST low.. Im pretty sure it was in french..

I have a Genlock that would work with the ST, but only in HI RES.
Probably not what you want. It will accept VGA video
from a Falcon (PCee or Mac). You can send video from your camera
through the unit to a VCR (or Projector), set the overlay bit, and
text or images from your computer are placed on top of the video.
It has both composite and SVHS input.
Funny, it is manufactured by the same people that made
Computer Eyes. I think it is limited to 256 color. If you can find
Digital Visions web site, you can find more info on the unit (TV Eyes
Pro).

As far as ComputerEyes goes, the Video Master captures images with
much, much higher resolution. Computer Eyes looks more like a "painted" image.
There is an application that dithers the Computer Eyes image to a
Spectrum format of 512 colors, but the name excapes me.

I have posted both units for sale earlier, but had no interest.
$50.00 for the Video Master and $100.00 for the Genlock.

Hi,

I think LED handles this too... For those not knowing: LED is an offline
reader for Fidonet-like stuff. Used to be shareware, last version became
freeware. Stephan Slabihoud probably stopped development. It must be
available at BBS'es, perhaps on FTP-sites.

> Drive case as well as the CPU box. What are these for?
> Also, how do I tell which version of TOS it is running?

The batteries are for the Real Time Clock.

The TOS version should be 1.02, though some of the later Mega STs had
1.04 (rainbow TOS).

In colour mode, if you click on the desktop Information menu and get a
fuji with rotating colours, then it's 1.04, otherwise it's 1.02. The
dates are also a clue. You can get sysinfo.prg too which will give you
all the hardware specs of your system.

Run an original copy on a real ST ?

This sort of thing happens on emulators. People just expect them to run
just like the real thing, but the fact is that no emulator will ever be
100% compatible with the original machines, especially when the various
varieties of original machines weren't 100% compatible with each other
anyway.

Just try another TOS version/RAM setting/video mode, etc... Some other
things won't run whatever you do.

Run First Word Plus, load the document, in the 'EDIT' menu of the menu
bar click on the 'WP Mode' to remove the tick, and then select 'SAVE
AS...' in the 'FILE' menu, save the document with whatever name you want
to give it. The file should be saved in text (ASCII) format.

I'm prepared to do it for you, if you're stuck.

>for both term power supplied by drive and by host?

Hi

I've got the drive detectable, as a previous posting.

What I'd like to know is why doesn't HD Driver detect the drive on the
other drive ID's, as opposed to just ID 1!!!!!

HDdriver obviously isn't doing something it should!

Just as a matter of interest I tried some other hard disk drivers, and
they all detected the drive!!

What happens if I get another drive and HDdriver WILL NOT detect it on
an ID other than ID 1!!!!

I'm not alone on this point. Should be start up a HDdriver SCSI device
list, where a list is kept of who got what device on x ID so we can swap
and change devices in case the above situation occurs;p

>

First of all, the Quick FAQ has most of the info you need to get
started, as far as setting up, booting, file types, etc...

Normally a 520 ST is a 512K machine, unless it has been upgraded to 1Mb.

If she wants to use it as a word processor, she'll need word processing
software. The older standard is 1ST Word or 1ST Word Plus which is not
much more than a text editor with basic effects.

I would suggest something like Script, which is a nice compact little
wysiwyg word processor, with a very nice output, even on dot matrix
printers.

If she is very serious about it, then the modern solution would be NVDI
(screen accelerator and printer/screen driver with truetype font
support), with Papyrus which is a full fledged WP.

Atari seemed to have economized (what a change!!) by using substantially the same the same molding for the Megafile Hard Drive (I assume that's what you have got) as for the MegaST. The 'battery' space in the HD top does nothing, at least it did nothing in mine. I dished the HD a long time ago and now use the case for housing a CD drive and second SCSI.

As far as what TOS, I think you just look in the 'Atari' alert.

Have just down loaded and read the 'Unofficial Hyp File' for Photoline from Coventry Atari Users Group (Nick Ripley). Very nice piece of work, but what depressing reading re. the comparison of the Atari/TT version and the PC version and the cost/value comparison between a low end PC/LE photoshop set up and the (functionally inferior) TOS equivalent package. I knew all this already, but it's somehow worse when someone of Nick Ripley's standing reinforces it. From where I work I know that Atari and many programs were very innovative for their day (see my previous postings), and that to this day the lean programming forced by limited memory has given the TOS and clones platforms some amazing programs for their size, but unfortunately, in a world where market forces rule, giving rise to mass production, resulting in low cost RAM production, resulting in lazy bloated programming, the fact that the ï¿½60 or whatever Photoline for PC has more features etc, is inevitable, the vast PC public love it and to them, size does not matter. Most of the stuff that passes across my desk is unnecessary self feeding bloat, buts that's life and it does keep people employed. Coupling the above Hyp. with Bengy's review of the iMAC and MagicMac (see his marvellous pages), fills me with dreams of what could have been if Atari had been spelt IBM and/or Bill Gates had been christened Tramiel..

Yup, but in the "good" old days self-modifying code usually meant a clever
hack which modified offsets (or even entire instructions) inside tight,
running loops... I remember using something like this in a wobbling
scrolltext ages ago (around 1990), it definitely didn't work on my Falcon ;-)

>>really doesn't matter on Falcon-accelerators.

> No, that is wrong. Falcon TOS also detects TT-RAM, but if an unpatched

Really? I did not know that. Why on earth should it do something like that?

> Falcon TOS does find TT-RAM it will bomb, because the TOS will attempt
> to use blitter in that RAM area as well, not realizing that the hardware
> registers only use 24-bit address pointers.

The Falcon VDI doesn't have any software-blitting at all, that's why it fails.
This is the same situation as on the AB, when TOS is notified about the
FastRAM you *must* use NVDI, otherwise any blits to/from FastRAM fails. I
guess the built-in VDI can be patched, but doing so is probably just a waste
of time since "everybody" use either NVDI or a graphics-card anyway.

> That is one reason why the CT2 TOS 7.x boot mode with FastRAM is so complex,
> and the main motivation why the address of FastRAM was not made equal to
> the standard TT-RAM address to begin with. But there are better solutions.

On the AB the FastRAM still has to be "installed" using Maddalt(), even after
it's remapped to TT-RAM. If you're interested in knowing more about how this
is done on the AB Doug Little has written some interesting docs on it, I can
mail it to you if you're interested.

>>But this means that you would have to introduce the split memory-model in
>>both the Hades and Milan, I don't think the designers did it they way they
>>did because they're stupid?!?

> I do not see what you mean by that statement. Stupidity has nothing to do

By "split memory model" I mean max. 14Mb "ST-RAM" and the rest as TT-RAM.

> with the matter. If they want to make a computer with a continuous RAM
> area, not split in any way (as by having IO ports at $00Fxxxxx) that is up
> to them, but it will not be Atari compatible. All Atari compatibles that

It is "splitted" in this sense (otherwise nothing would work, obviously), but
on the Hades everything is "ST-RAM", there is no TT-RAM or alternate RAM. The
advantage of this is that all memory is DMA-capable.

1.02 was the first TOS to support the blitter, it was called
"blitter-TOS" in some UK magazines when it was released. Other
than that there is not much difference between 1.00 and 1.02.

Hi,

I've repartitioned my HD, and lost a few important programs. Does anyone know where you can find Backward III these days ? Didn't it go freeware some time ago ?

I'm also looking for DFBoot and Videl Inside, I can't seem to get my hands on them...

Hi Kylo,

Kylo <grabek@hermes.umcs.lublin.pl> wrote:

> Did anyone install Debian on Atari TT? I have problems with it.

This is really a very detailed description. What kind of problems?

If you want to install the latest Debian version (2.1): There is a bug in
the install program. It doesnï¿½t recognise partitions of a harddisk as valid,
if the first partition on the drive is bigger than half of the harddiskï¿½s
volume. You can avoid that in putting a small partition e.g. swap in first
place.

Regards,

Kerstin

For Videl Inside just go to:
ftp.lip6.fr/pub4/atari/Falcon/Graphics/vi_2_04.lzh

Possibly the other programs are there at the same site too.

I think there were a few strip poker games for the ST. The best one I
have is called Hollywood Poker Pro by reLINE/Rainbow Arts.

One plays Five-Card-Draw Poker against 1 of 4 "of the most accomplished
and glamorous players you'll ever meet." According to the docs. ;)

It does play a good game of poker and the digitized pictures are some
of the best I have seen in a ST/STe strip poker game.
They certainly seem to be more than 16 colors pictures. Maybe 256c or
better. The Intro to the game features a nice dancing silhouette set
to some type of techno music.

There is even a Zoom feature to zoom in on any part of a picture.
2 disks in my package with a card that contains the password codes
which is needed to see whats underneath.

I think the game will run on a 512K ST but more memory will
prevent alot of disk access.
I know the game does work on a 4meg STe Tos 1.62.

Not sure what format the graphic files are in, would be interesting
to know.

The credits mention the use of a digitizer by: Newtek and a Sound
Sampler: Deluxe Sound. Never heard of these, anyone know anything
about this digitizer and sound sampler?

Raise ya $1,000,000. ;)

I thought the number of bombs did have a defininte meaning I'm sure there was an issue of the ST Format Magazine that told you but maybe I just imagined it! A multiple error sounds most likely though. But I'll try running Championship Cricket on my 1040 STFM to see what happens but I don't have a real copy - I think if I use pcdrive I will be able to copy it over. I know what you mean about the emulators though I don't expect it to be perfect becasue after all its only on a PC!

Thanks for the advice though.

No, nobody can answer that question. Bomb numbers 16-23 are unassigned.

The most common numbers are basic error numbers, 2 for bus error, 3 for address error, 4 for illegal instruction, and 5 for zero divide, all meaning that something got confused.

I have looked this up so many times that I finally wrote it in the Error Codes section of my Compendium, where it belongs.

It has been four years since the 12/93 version of the FAC was last posted. That is my mother lode of such information.

Actually, the reason for the error message when using the clipbaord is a known conflict with the odd message that this (and other apps which use the same libraries) broadcast in order to indicate that the contents of the drive containing the clipboard directory have changed.

You will get an alert if you are running NeoDesk 4 because it confuses this message with another one it expects to receive when an application it has run terminates.

You are right, the bombs do have a meaning. IIRC multiply the number of the bombs on screen by 4 gives you the exception that caused the problem.

The only problem is by the sound of it you have had more than one lot of bombs, or more than one exception error. This means during execution of the error, whether it be address, bus... another exception happened and another etc.

For a guess the 20 bombs went from one side of the screen to the other! So it's safe to say that if the screen had a larger resolution (more dots on the screen) the bombs would have kept on going until the machine hangs up.

And this runs the real time clock in the Atari itself.

>What are these for?

You seem to have got too many RTCs :-) Forget the one in the drive
case and just power the one in the Mega.

The RTC in the drive case would have been useful for anyone running a
standard ST as these do not have their own RTC.

>Also, how do I tell which version of TOS it is running?

Best to get a copy of SYSINFO as this will tell you loads of other
things about your set up as well.

I have the Deskstar with 10 GB in my Milan. Provided you use the latest
HDDRIVER with LBA-Support, there shouldn't be any problem using the huge
IDE drives you get nowadays. AFAIK, Cecile (sp?) from Centek also offers
LBA support.

Ciao

Thomas

Hiya

I have tried everything, including the drive on it's own with the
jumpers set to provide power for the adaptor.

It doesn't matter where in the chain it goes, even on a basic level 2
devices, it's only noticed by HD Driver as device ID 1.

The driver DOES notice the device when the device is switch on and
before the device checks the media with SCAM mode set!!!! with any ID.

Why does HD Driver have problems detecting devices, I still have a CD
multi-changer that is invisible to it, and ICD's software doesn't?

I feel that I'm repeating what I've already mention in previous
postings.

Not sure if any of the above hard drives will work, would be
interesting to know.

Are these 2.5 NoteBook IDE or 3.5 IDE?

From what I have seen the 3.5 IDE's tend to be cheaper than the
2.5 IDE's.
But if you have a Falcon in a stock case you can squeeze Two 2.5
IDE drives in it, if ya fiddle around a bit.

I have a Toshiba 6.4 gig 2.5 NoteBook IDE in my Falcon and it works
great. I started to get a 10 gig or larger but with partition limits
at 1 gig with HD Driver (Documented), Maybe 2 gigs per partiton
(UnDocumented) and only having 14 Drive partitons with TOS 4.04,
C thru P, I still wanted to use SCSI drives for D2D recording
and etc. So for me the 6.4gig was just the right balance.

However other OS's may support more than 14 drive partitions,
I would rather stick to TOS 4.04 on this myself. 14 gigs is
enough room for me, at least at the moment.

UWE of HD Driver would probably know if these drives will work.

Make sure you've got the latest HD-Driver....it is the only thing I'd trust with disks that size and IDE.....I use it on my 4.3Gb, but I don't run partitions over 500Mb yet.....I'd say avoid the Seagate, they have caused problems in the past (basically cos they try to help PC owners out a bit./...)...I use IBM drives`, both IDE and SCSI and I like thema lot...fast, quiet and reliable....

I don't know the Whiteline CD, but the actual Debian version is 2.1.

> A swap partition on SCSI 0 in a Syquest 44 Mb exchangable is not seen.
> A swap partition on harddisk SCSI 1 (part 3) is seen.

What were the partitioning schemes? As I already mentioned, Roman just discovered a bug in the source code of the installation program. If the first partition on the drive is bigger than half of the drives volume, the installation program will think, that it is not valid. Since the only(?) partition of the SyQuest is bigger than 22 MB, it is treated as being unvalid, while on the harddisk with at least five partitions none is bigger than half of the drive, so all of them are recognised (in the source code was a mixup of units: kbytes versus sectors).

Try this with the SyQuest: Change the place of the partitions, make swap the first partition or, if swap is the only one, add a very small partition as a first partition. You could e.g. put a small TOS partition in the beginning and copy the kernel and the bootstrap.ttp to it, something like 3 MB or so. This trick would help to cope with that nasty bug and the first partition would at least be somehow useful.

> Linix part. is nr 5.(ok)

This agrees with that partition recognition bug.

When I tried to install Debian 2.1 on my TT, dinstall did find all TOS/VFAT partitions on the internal harddisk, but none of the partitions of the Fireball on which it was supposed to end up, and surprisingly none of the partitions on my SyQuest 3270S with an already installed Debian 2.0 system! On both external drives the first partition exceeded half of the drives volume. The Fireball has 1.2 GB and the first partition had 700 MB, on the SyQuest the same was true with 230 MB as LNX and SWP being second with 30 MB. Fdisk did see the all of the partitions, but dinstall could not cope with it. After moving the 80 MB SWP to the first position and the 700 MB LNX to the second, everything worked out fine. It should have worked as well with the third LNX with 300 MB.

> Installing any application with the dinstall gives 'happy memory
> dump'. OK., Linux recovers beautifully, but...

Hmm, I don't trust all those CDs. My first attempts with the old ALD were as well quite frustrating. I don't know how fast your access to the internet is, but perhaps it works out better, if you download the base files for the installation from a debian server, e.g. ftp.de.debian.org and use the CD only for installing the packages with dselect after the basic system is up and running? The biggest is base2_1.tgz with approximately 8 MB.

Regards,

Kerstin

Hi Joost,

it all depends whether you want http refs in what color etc, but if you
want them Bold & Blue just add
texteffect=1 4 http://[^]+
to your O.INF, and put it first in the "text effect" section.

I know, those RE's are terrible for a simple soul, but it works :-)
It's got nothing to do with Unix, I'm afraid...

You may use Save as.. option (shift-f2 if I remebered right), right
over or under Merge in the GfA ST-editor.
Then you can with simple fixes use Merge OEM-text in your
Gfa Windows or Gfa DOS.
The problem with Gfa DOS/Windows is that it's just a bad
copy of the Atari version, and theese versions blocks the
system instead of increasing its posibilities.

/Jeppe

Hello,

Same thing with Atari TT - when it came out there were a few programs that did, if I remember, some stack commands. These were different than on the Atari ST (pushed more data). I used a machine code debugger to locate where it failed, but didn't know enough to be able to write a patch. I spoke with Dave Small, who had gotten around the problem for his Mac emulations, but never convinced him to tell me how or give me some code!

If you've got some Atari ST(e) emulator it might work.

Sorry - Ross.

The command you want is ATW(0,1,2) where ATW0 displays the serial port speed, ATW1 displays the line speed, error correction protocol and serial port speed, and ATW2 displays the line speed.

Unfortunately I don't know for your modem but one that works with
several modems (Zoom, Supra etc) is ATW2. It reports DCE (modem
to modem) speed only. I hope it works for yours also.

3168. HD Driver and MAGIC

Newsgroup: comp.sys.atari.st
Date: 1999-05-20 00:00:00 UTC
From: leaver@dynamite.com.au
Message-ID: <7i25sq$6v0$1@black.interact.net.au>
Source record: 78421

I have a problem which is vaguely related to the one that Jo Even Skarstein has written about, but it afflicts MAGIC, not TOS.

I am using a TT with internal Quantum Fireball, so I boot HD Driver from a Seagate 46mb drive that was once in my MSTe. The rest of the boot is from the C partition of the Quantum.

I have Magic 6.01 and HD Driver 7.00, 7.61 and 7.71.

Booting to TOS 3.06 with any version of HD Driver is completely reliable.

Booting to Magic with v 7.00 is completely reliable.

Booting to Magic with v 7.61 or v 7.71 is not. Frequently, but by no means always, the booting process hangs somewhere. The place where it hangs is not consistent. It may stop with NVDI trying to find its fonts. It may stop with HS Modem loading.

The most peculiar situation brings in the relationship to Jo's problem. Sometimes it boots successfully, but to the standard video port rather than my Matrix card. When this happens, but only when, I discover that MAGX.INF has disappeared. The partition has been corrupted by something to the extent that where that file was, is now a missing sector.

There is one other oddity. On the ASCI/DMA port of the TT I have a SupraDrive FD-10. This is a venerable device that uses 10mb 5.25" floppies in an Hitachi SCSI drive via a built-in Supra adaptor. With TOS and any version of HD Driver, I do not need to insert a floppy at booting, nor do I need to with Magic and v 7.00, but if I boot to Magic with v 7.61 or v 7.71 I have to insert a disk before booting if I wish to use the FD-10. If I do not Magic will report "illegal drive" when I try to open a disk.

Yes, my third edition of the /Concise Oxford/, dated 1934 (and reprinted
1946 with ?only? a revised addenda) agrees with you. In fact it only
gives the word as an add-on to 'optimism' in the 'so...' section and
does not even explain its meaning properly, just 'optimIZE(2) v.t. (f.F
/optimisme/ (L /optimus/ best, -ISM))'!

Hi. have received and installed the FPU. The one I bought last year from
System Solutions seemed slightly bigger and it jammed and pins broke.
Yours slipped in!! and it works. Thanks very much. Your cheque posted
this morning (thurs). Am interested in the board - see my problems with
CAB and OUTSIDE and MAGIC. Can you mail me details of board.

Bob King.

Since we're calling up naughty computer memories, my first adult software
was for the Apple][+ on a monochrome (green in this case) monitor. It
put up a hires monochrome pic of a gril, naked and legs spread wide open.
Then the disk drive spun up, and the data head was moved back and forth to
create "moaning" sounds. Pretty good for a machine that only had a
simple, toggle-click speaker.

At Bravo Sierra Computers you'll find Used and New Atari. Items you've been searching for. Item's new to you and Classic Atari long lost. Have you got Hardening of the Ataris? Check out Bravo Sierra Computers! Have you hugged your Atari today? Buy your Atari & yourself a present today! Buy from someone with 16 years of Atari experience. Buy from someone personable, polite & passionate about His Atari! And if I don't have what you want to buy or I don't know the answer to your question, I'll refer you to someone who does. That's the nice thing about the Atari community and my colleauges in the Atari business. We would rather send our business to a fellow competitor to get what they need than have someone abandon their Atari due to lack of support. For myself, I only use Atari! I get on the InterNet with my Atari ST, I use PageSTream for all my DeskTop Publishing, my DataBase is DataManager ST & besides playing games on my Atari ST I play games on my Atari Jaguar with my collection of Jaguar Games! I won't own neither a PC or a Mac. So buy from someone with a servant's Heart & someone who'll be around to offer you Atari support!

I've just added to my ST SoftWare Catalog 30 more titles. All brand
new. In my ST software catalog new titles are listed at $15. Just like
BattleZone below. But for a limited time the $15 titles are on sale for
$10. So go ahead and check it out. All of these titles are *NEW. Just
think of this as a "Come spend your Tax Refund in my store sale!".

BattleZone; Atari;
Color or MonoChrome Monitor. One or
two players. Full 360 Degree action.;
*NEW.....$15.00 U.S.

>characters in them.

Okami is exactly what you need!
I always read Unix MAN's using this programm.
In Okami you can define 256 different text effects - only some of them are
defined as default.

Here is an appropriate fragment of O.INF:

=== advanced users only ===

The following configuration sets up regular expressions that O
identifies and displays in alternative text attributes. For
example, you can make O display _this_ as the word "this" in
underlined, or print all quotes in a different color, etc.
Every `texteffect' line sets up one such pattern. The syntax is:

texteffect=eff color RE
Where:
`eff' is the text effect to display the matched text in.

I know this. The texteffects part of my setup is heavy enough for the
moment and slows down a little bit the display ;-)
Nevertheless, I'll try to set it up for this purpose too.

Bye,
/Pascal/

You are connect via NULL-modem cable !
So why are you doing a dialling ? There is nothing on the end of the cable which understand ATDT or any AT commands. The AT commands are for the modem commands control only. There is no modem now.

Using NULL-modem between 2 computers, the computers are connected once you power on. What you can do to test out, is to run a terminal program (like connect) on both sides, make sure that the line speed (ie baud rate) and other RS232 settings are the same (7bits, startstop, etc), and start using it i.e. type some characters on one computer and see if the other computer have anything coming out on the screen. Normally you will see something, if they are not what you type, then it is the RS232 settings which are the problem. There is no modem here to help you auto-set these now. :-)

> difference either...Does anyone know if BBS Express! ST is
> capable of recognizing an incoming signal from a null-modem
> cable? Hmm...

I am not sure, but if you tested it by using above method, then you can try the BBS software.

You may want to read about connecting ST to Win95 using NULL modem on my web page, it's the same principle. Now you are using 2 ST instead. The section is about 3/4 down the page. Have fun :-)

3189. HD-Driver and TOS 2.06/3.06

Newsgroup: comp.sys.atari.st
Date: 1999-05-20 00:00:00 UTC
From: josk@my-dejanews.com
Message-ID: <7i0nvd$lj5$1@nnrp1.deja.com>
Source record: 78476

I have a problem with HD-Driver (7.12) and TOS 2.06 and 3.06. If I boot with HD-Driver TOS will crash as soon as the desktop tries to read newdesk.inf (it says that it can't allocate the window-buffer). If I hold down CONTROL, the desktop doesn't look for newdesk.inf and everything works as it should.

If I run MultiTOS I have a similar problem, if newdesk.inf is present the AES will crash with a bus-error as soon as I use the menu. If I delete newdesk.inf there are no problems.

This happens on my Mega ST (IDE, TOS 2.06) and my TT (SCSI, TOS 3.06), but not on my Falcon (IDE, TOS 4.04)... It doesn't matter if I boot with no accs or auto-programs, or even if I boot from floppy. With an old AHDI I have both the Mega and TT works fine, but AHDI lacks some features I need so this is not really a solution.

Has anybody experienced something similar, or is it just my Mega and TT?

Jo Even Skarstein

Hope you received my e-mail and attachment. I tried to add a message,
but after I had attached the Videl ZIP and gone to 'edit' (in Edith) I
found the cursor lying on the first char of the address and the ZIP file
hard up to the bibliography. What am I doing wrong with Newsie? Surely
you can make up the recipient section, then write/edit the message text
and then add any attachments? I think I'll switch to Mymail, at least
the HYP file has screen dumps.

I downloaded Videl from:

http://www.geocities.com/SiliconValley/Sector/9449/downloads.html

The Rebel BBS pages, just to make sure I had the latest.

Bob King.

3191. FS/T: Atari ST games [05/20/1999]

Newsgroup: comp.sys.atari.st
Date: 1999-05-20 00:00:00 UTC
From: VideoGameAdvantage@DittosRush.com
Message-ID: <375cd3c7.47035733@news.nls.net>
Source record: 78478

All Video Game Advantage (VGA) FS/T lists are updated approximately
every ten days available on the WWW at http://www.io.com/~vga2000/

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 05/20/1999

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site. Unfortunately, none are for the Atari ST computers,
at this time...

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari ST computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection is currently on-line! Unfortunately, there is no
list for this system (cartridge and CD based systems only).

I have the following Atari ST software for sale or trade.

Unless specified, all items are *NEW* and are still shrinkwrapped.

SOFTWARE:

ATARI ST COMPUTER:

New diskette(s) [still shrinkwrapped! Includes box and manual]:
$ 6.00 Advanced Dungeons & Dragons: Heroes of the Lance (SSI)
$ 6.00 Alcon (Taito)
$ 6.00 All Aboard! (Terrific Software)
$ 6.00 Arkanoid (Taito)
$ 4.00 Art & Film Director (Epyx) -- $4.30 shipping, due to
weight, counts as 1st item
$ 6.00 Art Library 2 (Melody Hall) -- RIPPED SHRINKWRAP!
$ 6.00 Auto Duel (Origin Systems)
$ 6.00 Awesome (Psygnosis)
$ 6.00 Battleship (Epyx)
$ 6.00 BCPL Compiler (MetaComCo) -- RIPPED SHRINKWRAP!
$ 6.00 Blockout (California Dreams)
$ 6.00 Bobo (Terrific Software)
$ 7.00 Bubble Bobble (Taito)

$ 3.00 California Games (Epyx)
$ 6.00 Championship Wrestling (Epyx)
$ 6.00 Crash Garrett (Metal Hurlant)
$ 6.00 Cyber Print (Antic Software) -- NO SHRINKWRAP!
$ 3.00 Death Sword (Epyx)
$ 2.00 Devon Aire in The Hidden Diamond Caper (Epyx)
$ 6.00 Dive Bomber (Epyx)
$ 2.00 Dragon Scape (Free Spirit)
$ 6.00 Dynasty Wars (Capcom)
$ 6.00 East vs. West Berlin 1948 (Time Warp)
$ 6.00 Eliminator (Hewson)
$ 6.00 Emperor of the Mines (Impressions)
$ 2.00 Final Assault (Epyx)
$ 6.00 Forecaster III (Greg Kopchak)
$ 3.00 GFL Championship Football (Gamestar)
$ 6.00 Golden Path (Firebird)
$ 6.00 Goldrunner II (Microdeal)
$ 6.00 Hoyle Official Book of Games (Sierra)
$ 6.00 Hyperdome (Exocet)
$ 6.00 Impossible Mission 2 (Epyx)
$ 6.00 Jewels of Darkness (Firebird)
$ 6.00 Jupiter Probe (Microdeal)
$ 6.00 Karateka (Br0derbund)
$ 6.00 Keith Van Eron's Pro Soccer (Microplay)
$ 6.00 Knight Orc (Rainbird)
$ 6.00 L.E.D. Storm (Capcom)
$ 2.00 Lands of Havoc (Antic Software)
$ 6.00 Last Duel (Capcom)
$ 6.00 Leander (Psygnosis)
$ 6.00 Major Motion (MichTron)
$ 6.00 Man Hunter: New York (Sierra)
$ 6.00 Man Hunter 2: San Francisco (Sierra)
$ 2.00 Mean 18 Famous Course Disk Volume II (Accolade)
$ 3.00 Metro Cross (U.S. Gold / Epyx)
$ 6.00 Moebius (Origin Systems)
$ 3.00 Paint Pro (Abacus Software)
$ 6.00 Phantasm (Exocet)
$ 8.00 Planet of Lust (Free Spirit) -- ADULT content!
$ 6.00 Police Quest 2 (Sierra)
$ 6.00 Powerstone / Elf Lord's Magic (Starsoft)
$ 2.00 Prime Time (First Row)
$ 6.00 Professor Craps (Scorpio Systems)
$ 6.00 Project Neptune (Epyx)
$ 3.00 Quadralien (Spinnaker)
$ 6.00 Rambo III (Taito)
$ 6.00 Red Lightning (SSI)
$ 3.00 Renegade (Taito)
$ 6.00 Rick Dangerous (Microplay)
$ 6.00 RVF Honda (Microplay)
$ 6.00 S.D.I. (Cinemaware)

$ 6.00 Savage (Microplay)
$ 6.00 Silicon Dreams (Firebird)
$ 6.00 Slayer (Hewson) -- NO SHRINKWRAP!
$ 6.00 Space Quest I (Sierra)
$ 6.00 Space School Simulator (CRL Group)
$ 6.00 Star Quake (Terrific Software)
$ 6.00 Starglider (Rainbird)
$ 6.00 StarRay (Logotron Recreation)
$ 6.00 Stationfall (Infocom)
$ 6.00 Stunt Track Racer (Microplay)
$ 2.00 SwiftaR (Accustar)
$ 3.00 Techno Cop (U.S. Gold / Epyx)
$ 6.00 The Advanced OCP Art Studio (Rainbird)
$ 6.00 The Colonel's Bequest (Sierra)
$ 6.00 The Games (Epyx)
$ 6.00 The Guild of Thieves (Rainbird)
$ 6.00 The Pawn (Rainbird)
$ 6.00 The Sentry (Firebird)
$ 6.00 The Viking Child, Prophecy 1 (Imagitec)
$ 6.00 Tower Toppler (Epyx) -- NO SHRINKWRAP!
$ 6.00 Transputor (CRL Group)
$ 6.00 True BASIC (True Basic Inc.) -- NO SHRINKWRAP!
$ 6.00 Typhoon Thompson: Search for the Sea Child (Br0derbund)
$ 4.00 Warship (Strategic Simulations, Inc.)
$ 3.00 Winter Games (Epyx)
$ 6.00 Wizard's Crown (SSI)
$ 3.00 World Games (Epyx)
$ 3.00 World Karate Championship (Epyx)
$ 6.00 Zero Gravity (Microdeal)
$ 6.00 Zork I (Infocom)
$ 6.00 Zynaps (Hewson)

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.20 for the first game and $1.10 for each additional game. Shipping for hardware and accessories depends on weight/distance. Large orders will be weighed as a package, to reduce shipping costs. Foreign orders welcome.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I

collect for over 50 different systems, so please feel free
to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping
costs. Shipping cost depends on both the weight of the order
and the distance that the order must travel, unless a set
amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't
serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly
listed. There is no minimum order.

7) If you have a problem with the listed price, please remember
that nobody is forcing you to buy from me. I have been in
business since 09/05/93, so I have a good idea how to price
items. My personal philosophy is that something is only worth
what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order
-drawn from a U.S. bank branch-, or cash. Orders from outside
the U.S. are also accepted (also, please check out my want
lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your
order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in
(please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this
information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

Michael J. Novak Jr.

3192. BBS stuff, again

Newsgroup: comp.sys.atari.st
Date: 1999-05-20 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <3743cbd09dcae630@holleman.demon.nl>
Source record: 78479

Hi,

I've added two new areas to my small BBS, areas Software-Games and
Software-Matrix.

The first one holds just a few old monochrome games, plus 24-Bit program
that sometimes is needed to run them on a TT. More games will be added in
time. I think I've got a (demo) copy of the Revenge of the Mutant Camels
lying around here :-)

The MATRIX subarea now holds all the stuff I also put on my homepages.

The MISC subarea now has SoftPC and the Insignia files added.

In the LOCAL (LOKAL actually...) area I've put a Filelist with all
available files for D/L.

Once more, suggestions and feedback are welcome.

>
This sounds like an incompatibility between Gemini and MagiC. I found the
text 'Gemini goes Mag!X' Version 1.3 19. M?rz 1993 by Oliver Scheel, but
MagiC has changed a lot from theese days... I'm not sure if there is
something newer (this one is in German, so I'm not sure what it does).

>On the Milan, both Falcons are there even with Gemini as Desktop.
>
Hmm, the above text also says (goes MultiTOS) ;-) and I think MiNT has
stayed more compatible over the years than MagiC!

>
[sniped tests]

>Transfer from Falcon #2 to Milan via #1. The copy program in charge was mgcopy,
>running on #2. IP link established with 115k2 via Modem ports between Milan and
>#1 and via Midi ports between #1 and #2. Transfer time was 06:00 minutes for
>346795 bytes. Very slow, but again: no errors.
>
Very slow indeed ;-(but BNET has nothing to do with it. Routings etc are
STinG's responsibility but the network administrator ;-) must ensure that
he has a 'fine tuned' system! This mostly includes avoidance of unnessecary
fragmentation (MTUs, MSS, RCVW), excessive retransmitions (def RTT), system
load etc. Might take some time, but at the end you'll get the best results
for your setup.

>During my tests today, I encountered numerous crashes of both falcons. These
>happened mostly as soon as the Midi connection was involved. Might be some
>buffer overflow due to missing handshake or the like, but is not really
>reproduceable. Both Falcons were up and running for over an hour now during
>most of the tests.
>
Maybe you can try with larger buffers in MIDI.PRG (4096 bytes or more). I had
tried MISY=ON once and I had crashes using midi. So, I think this setting
should be OFF. Otherwise midi connections are very stable (even from the first
STinG versions).

It's also possible that one or more of your AUTO or ACC programs are responsible for certain crashes, especially if even one of them can overwrite certain memory areas (buffer overruns etc). This can pass unnoticed in normal operation and cause a crash with STinG (or when STinG is using much of its memory).

>BNET is working flawlessly, though, although there is some trouble with Gemini
>under MagiC.
>
I'll try to test it since it was my favourite desktop some (many;-) years ago, but please note that not all programs are prepared to run in a network environment. Most of them simply assume that drive/path are local and don't care to ensure that the last Dsetpath is really the last (which they should, even for 'normal' multitasking operation). BNET tries to make its best to ensure this (even Superbase, which does all sort of tricky bits with path handling, works fine), but can't be always successful.

>So, there is no need for more excessive testing under MiNT, as long as no other
>users will encounter problems.
>
Ok, that's really good news, I'd like to access MiNT with more 'common' drivers like NFS or other.
Thanks _a lot_ for your tests/reports, BNET is constantly under development, so such extensive testing is much welcomed.

Regards Vassilis

> The credits mention the use of a digitizer by: Newtek and a Sound
> Sampler: Deluxe Sound. Never heard of these, anyone know anything
> about this digitizer and sound sampler?

Newtek never made anything for an Atari computer. Given the era of this
game, no doubt the graphics were done on an Amiga using a Newtek
Digiview. The Digiview was a slow-scan parallel port video digitizer
capable of 21 bits of color info in its raw format, although typically
the pics were saved in HAM format (12 bits per pixel maximum).

I suspect that also means the sound was done on the Amiga as well, but my
memory cannot verify that the Deluxe Sound was an Amiga-specific product.
:)

Couldn't agree more. I'm not knocking the Atari, I was using the 8-bit 800XL in the office to database my output and a marvelous PD word processor called Textpro, for my reports, whilst the rest of the examiners were still using quill pens (perhaps I exaggerate!!). As soon as Protext came out for the PC I started using it in preference to WordPerfect for the macro features and its total in-text control. Now however, I have a 19" COMPAQ multisync and the VGA limited Protext window is just too small to use. Papyrus is a superb WYSIWYG wordprocessor/semi DTP package and the fact that it is making inroads and noise in the PC market, testifies to its quality. I cannot specify which companies have been 'surprised' by things like the Atari Touch Tablet/Atari Artist combo, or Neodesk or CAD-3D, but they are very big boys indeed.

Photoline is a perfect example of our problem in although having starting the ball rolling, not having enough muscle to keep it rolling along our path.

Yes, your point about the cheaper hardware spin off is completely correct. I bought a 2.1 Gb IDE HD for ï¿½50, a Hayes Optima 28800 for ï¿½25 and a CD drive for ï¿½20, prices that, if driven by Atari only dealers (who are forced to keep thier prices high because of their limited market) and not the generic PC market, would be multiplied by up to a factor of say 4.

3197. Huge IDE-disks

Newsgroup: comp.sys.atari.st
Date: 1999-05-20 00:00:00 UTC
From: joska@nuts.edu
Message-ID: <7i14ifufu1@nnrp1.deja.com>
Source record: 78484

Has anybody tested any of cheap, huge IDE-disks? I was thinking about getting a 13-20GB disk in my Falcon. My local store has these in stock:

Fujitsu 13.7GB 3130AT (UDMA)
Seagate Medalist 10.2GB
IBM Deskstar 13.5GB
Maxtor DiamondMax 4320 13GB

All of these are cheap and more than fast enough for my Falcon, but I've heard that not all new IDE-disks will work. Is this correct? If so, which disk is safe to buy?

For HDDRIVER, like for any driver, the SCSI ID of a device doesn't
matter at all, i. e. all IDs are treated the same. If the ID makes a
difference there is most likely a problem with the cables or the
termination.

->the BBS stuff on as well, doesn't harm...

Don't get discouraged Louis! It takes awhile usually for word-of-mouth to
reach everyone. My first year? Ugh...probably didn't get 1 call a day for
a very long time. Of course at that time I was running head to head with
no less than 3 other PC based BBS's in my own county. For what it counts,
they are all gone now...(which either means we won, or I'm too stubborn
to give up on BBS'ing! <grin>) All my equipment is paid for, the extra
phone line doesn't cost -that- much to maintain...so we'll be around for
as long as I'm an Atarian (can someone say until Death?) ;-))))

For awhile, we were averaging 30 calls a day. It was intense...then we
got our 1st, 2nd and 3rd ISPs in our area...we now get around 5 calls
a day (and 1 is always me!) so its definitely affected us. Even more
amazing is the fact that we get just as many LD calls as local...the
Atari users in my area, despite my best efforts, are running on very
basic ST's (1 meg, floppy, 2400 baud, etc, etc,...) We have had meetings
at the local Library, Pizza Hut, and a local yearly electronics exhibition
where I show off my Nemesized, MiNT powered Falcon, as well as a Lynx and
Jaguar, but while they all look and go "wow, I didn't know Atari's could do
that!", I can't get them to upgrade... ;-((Heck, I even gave a base Jag.
game system away at last years HobbyFest!) ;-))))

Oh well...nobody said it was easy belonging to the ultra-elite cultist
group known as "Atarians", eh? <grin>

Catch ya later...

Hi Jo Even...

Well, I'm using HDDriver v7.61 on my TT but I had something like that
happen. It was my fault though. I just copied the DESKICON.RSC file from
my Falcon to the TT (there was nothing on the HD when I started working
on it), and saved NEWDESK.INF from there. Well anyways, the next time
I booted up, it crashed. So I figure either NEWDESK.INF or DESKICON.RSC
was corrupted. I installed new ones, not from my Falcon, and it worked
fine... Dunno if that will help you or not though... ;-(

From: darkchyld@pcc-uky.campuscwix.net
Message-ID: <7i14vs$8ui$6@news.campuscwix.net>
Source record: 78491

Hi. I'm trying to get my USRobotics 33.6 Sportser modem to show a "true" connect speed and not the speed between the computer (port) and modem. I've got the manual, and looked through it but can't seem to find what I need. I did find an ATB(1,0) command which looks like it affects the serial/connect speed, but its not it.

Anyone else know? I'm trying to get the "true" speed to showup in my ip-up file under MiNT. Right now it shows 38400 when I connect at 28800 or 26400...

Thanks! ;-)

Its that time once again! (thunderous drum-roll please-if you don't mind) The Winners at the DarkForce! BBS this month are as follows:

1) Bill (Bill Bykens) : 1 6 month/3 volume subscription to Atari Computing!

2) Dr. Clu (Greg Goodwin) : ST-Plus Fanzine!
3) Centurion (James W. krych) : ST-Plus Fanzine!
4) Angle (Shannon Slone) : ST-Plus Fanzine!
5) 69 (Brandon Blackburn) : ST-Plus Fanzine!

Congratulations to all our lucky winners. Don't forget-you too could be a winner if you call our BBS at least one time each month. All it takes is that one call, and it does not matter how long you stay on. Good luck to all of next months' callers! ;-)

PS You must take a permanent password when you call for the first time! ;-)

It is very difficult to tell jokes on Microsoft. In the end they all turn out
to be truth.

Out of curiosity I installed Borland C++ builder on my wintel laptop.
I compiled the famous program that puts "Hello world" on the DOS console.
No windows application!!!

After compiling about 143.000 lines!! I ended up with a .exe about the same size
in bytes.
But it worked!

I think one can have the complete MSDOS kernel linked in that amount of bytes.

Henk.

>thanks in advance.

There may be a better way...but...
You can put a copy of coldboot.prg in the auto folder of a virus free
floppy disk and keep that loaded in the machine during booting.
COLDBOOT.PRG does just that, it forces the machine to do a cold boot,
similar to cutting the Mega off at the power switch, then back on.
The Mega should in theory, keep rebooting till the hard disk has spun
up, at which point the system should boot from the hard disk.

Many hard disk utilities come with some form of coldboot, and if not
most atari FTP sites have it up for grabs.

Brian

3210. FPU advantages

Newsgroup: comp.sys.atari.st
Date: 1999-05-21 00:00:00 UTC
From: BobKing <robert.king@patent.gov.uk>
Message-ID: <37457931.8D31443E@patent.gov.uk>
Source record: 78347

I have at last installed an FPU on my Falcon. I can find no difference in speed between the ST/Falcon no FPU and the TT/Falcon with FPU versions of Photline 2.30, at least in the filter department. What am I missing. There is a list somewhere of progs. which are FPU aware and benefit, can any one point me.

Note all FPU chips are not the same!! The first one bought full price from SS was such a tight fit I bent a pin or otherwise bu*****d it up, whilst that bought from Steve Green at a fraction of the price, slipped in real easy - and worked first time.

Bob King.

> AT&B2 = fixed in ARQ mode, variable in non-ARQ mode

Ron, wake up pse...

You asked about ATB, so I gave you the meaning of ATB
Had you asked me about AT&B, you'd have received a different answer.
There IS a difference between the two... :-)

>
> Anyways, the ATW(0,1,2) command does not work on my USRobotics sportster. It
> gives an error if I issue it... ;-(
>
> Geez, wonder what does make it work? ;-(

Perhaps you issued AT&W2 ?????? No wonder, there's no register for that...

Try again with ATW2...

They both result in Pexec(). I do not use shel_write() for calling the editor. But you are probably right about the disappearance of the mouse, because Okami uses the extension to determine whether it must call a GEM program or a .TTP program, and sets the cursor etc. accordingly. However, I find this case significance rather inane now, and will change it.

You know that I've been having trouble with the TT's keyboard.
My spacebar just wouldn't work right, and I've been trying all kinds
of ways to fix it. from having an acme anvil hanging over it to ...
you don't want to know! Yesterday I tried one more, I use the slates
from mini-blinds to make lables for my iris beds, I took two of them,
about 1.5inch long, and placed them between the metal back and the
membrain sheet. as the blinds have a (shape, I placed them with the
bend facing upwards. IT WORKS. I might have to place one under the
left hand shift too, it's working part time.

>partitions over 500Mb yet.....I'd say avoid the Seagate, they have caused
>problems in the past (basically cos they try to help PC owners out a
>bit./...)...I use IBM drives`, both IDE and SCSI and I like thema
>lot...fast, quiet and reliable....

Then why is it, that I have all kind of problems with my new IBM 4.3 Gb
Travelstar.

At first it worked like a charm, actually right out of the box. I simply copyed
all data from drive C on the old 130 Mb IBM HD over to the new drive, and it
worked.
Then after a week I started getting programs that didn`t work, bad clusters, and
more. Try to run Diamond Edge, and it shows all kind of problems and I ended up
with god knows how many Lostdat files.
That was with AHDI 6.3. and 7 partition at something like 423 Mb.

Then I "borrowed" a HDDRIVER v. 7.1 and at first it was OK.
Good,- I was thinking and ordered a new HDDRIVER v. 7.72. But before it arrived I
was getting the same problems again. Loosing every program installed on the
drive, 1.5 Gb of data. Bad luck, I guess?

Then I start all over with the new HDDRIVER v. 7.72, new partitions and the lot.

Now I can`t get it to work with NVDI, every time I boot from the HD, it will
erase my ASSIGN.SYS file in the root. If I set it to read only, it rapport a
error when starting up. As of now this huge drive only countain what it needs to
boot,- MagiC v. 6.0 , some internet apps and a few other things.
And I did the same as on the first try, copying everything on drive C over from
the old drive.

At the moment I just don`t trust it. What ever it is that makes all this
problems??

Someone suggested a virus, but that was my PC friends, and what do they know
about Atari and virus??

Nah,- it must be something else, and it`s proberly my own mistake, but what am I
doing wrong?

cheers

Joergen

3218. GFA source for plot program

Newsgroup: comp.sys.atari.st
Date: 1999-05-21 00:00:00 UTC
From: john@JCordes.Phys.Dal.Ca
Message-ID: <7i4cfj$q1s$1@News.Dal.Ca>
Source record: 78355

I have released the GFA (v3.5) source for my freeware plot program
(last version plot174a.prg). The archive is available for anonymous
ftp at jcordes.phys.dal.ca, in the pub/atari directory. Or you can
use a browser pointed to the URL ftp://jcordes.phys.dal.ca/pub/atari.

Here is an extract from the 00index file:

plot174a.zip: This archive contains the compiled binary plot174a.prg, the
GFA V3 source file plot174a.gfa and the ASCII version of the
source plot174a.lst. Also included is the most recent doc
file plot172L.txt, a sample .cfg file and finally a short
notice announcing the release of the source of my plot
program into the Public Domain. Freeware by John Cordes.

Be warned that the .GFA file contains over 9,000 lines
of source code; the complete zip archive is about 243K in size.

The program doesn't run on TOS versions 3.xx or higher, but it does
run well under PC emulators such as Gemulator and STonX. I still use
it occasionally for the built-in numerical utilities, such as numerical
integration, and root finding for both polynomials and transcendental
equations.

Enjoy!

John Cordes

On my Zoom K56 the command is ATW2, you're trying to get your
modem to report DCE speed instead of DTE speed.

Yes, yes, yes! You are very right and even the http://[^ in your
message is bold and blue now. Took another look at the regular
expressions paragraph in the okami.hyp but it still beats me.....
Thanks a lot.
Regards, Joost.

Hi Joergen

Could it be that it is getting warm. I had the same problem on my Milan and it
was the powercord to the fan that somehow got disconnected, but the disk itself
makes so much noise i dont hear the fan (its really quiet). Hope this helps.

Cheers J�rgen

Perhaps it was AstroTits? My friend bought a pile of floppies at a garage sale and went throughthem and this was included...you were a penis at the bottom, and breasts fell from the top of the screen towards you, and you had to kill them by firing sperm at them. Quite funny actually. Oh, and the special defense was...you guessed it...a condom. Oh well. It was funny.

~Phil
"LenoTata Rex"

p.s.-i think the game was sacreligous. Bibles and crosses fell from the sky at a later stage.

SW LEXICOR all 4 Lexicor software packages together, great deal! (disk) $ 26

SW LIVRE Du Graphisme (disk) $ 3

SW M1 TANK PLATOON still the best tank sim out there, all original $ 8
manuals (heavy Microprose kind:) and box included, includes PC/DOS version too
(will run on 286&up!) (1 DOS floppy is corrupted, but I'll include a working
backup) (disk/docs)

SW MACRO Mouse by Antic, record mouse actions (disk) $ 3

SW MARBLE MADNESS from the arcade version, great fun! (disk/docs) $ 3

SW MEGATRAVELLER missing disk A it seems, disk B only (disk/docs) $ 1

SW MIGRAPH drawing utilities set includes TouchUp, MergeIt and Scan&Save, $ 6
manual for Mergeit only (disk)

SW NEODESK2 v2.0 the famous desktop replacement, might be upgradable $ 3
(disk)

SW NIGHTSHIFT 2 disks game by lucasfilm, so you know it's good! may need $ 1
a manual for copy protection (disk)

SW OMEGA strategy game by Origi (disk) $ 1

SW OSS Personal Pascal v1.02 (disk/docs) $ 3

SW OSS Personal Pascal v2 (disk/docs) $ 8

SW PIPE DREAM game by lucasfilm, so you know it's good! may need a manual $ 1
for copy protection (disk)

SW QUICKST v3 screen accelerator for ST/STe/TT (disk/docs) $ 3

SW RED STORM RISING submarine simulation 2disks one of the best realtime $ 3
strategy sim games for the Atari! amazing sim of realtime submarine combat
(disk)

SW SIMCITY the city simulator, great game! (disk) $ 3

SW SIMCITY very addictive simulation game, may need manual for copy $ 1
protection (disk)

SW SPEEDO starter kit, incl SpeedoGDOS and 20 bitstream Speedo outline $ 8
fonts & 5 disks of fonts from Toad computers; 9 disks in all! (disk/docs)

SW STALKER 2 older version probably upgradable (disk/docs) $ 3

SW STALKER3 v3 best telecomm modem software (disk/docs/box) $ 19

SW STENO 1 older version probably upgradable (disk/docs) $ 3

SW STENO2 v2 best text editor works great with STalker (disk/docs) $ 10

SW SWIFTCALC ST by Timeworks great spreadsheet with graphing 2disks $ 7
(disk)

SW TEST DRIVE 2 the duel, European challenge addon, the supercars addon, $ 3
great car racing game with 2 bonus packs of cars! 4 disks (disk)

SW TEST DRIVE by accolade (disk/docs) $ 5

SW UIS Universal item selector v1.0 the best file selector replacement $ 1
(disk)

SW UMS Universal Military Sim, looks great especially in mono $ 3
(disk/docs/box)

SW UVK Ultimate Virus Killer (disk) $ 10

SW WARP9 speed up the graphics on all TOS machines lots! (disk/docs) $ 13

SW WORD For Word crossword puzzle creator (disk/docs) $ 3

SW WORDFLAIR v 1.1 the integrated document processor (disk/docs) $ 11

SW WORDWRITER ST a fast easy to use word processing system from Timeworks $ 3
that can interface with their Spreadsheet & DB (disk/docs/box)

SW WORDWRITER ST by Timeworks great graphical wordprocessor (disk) $ 3

SW WORLD GAMES by Epyx challenge yourself or a friend in different $ 3
events! (disk/docs)

SW Z-RAM Diagnostics v1.1 for use with Z-Ram RAM upgrades (disk) $ 1

SYQUEST 44MB removeable hard drive w/1 cartridge in 2-bay (1 bay free) $ 71
"shoe box" style external case incl host adapter so you can hook this drive
directly up to any ST without an expensive ICD Link. The case has a DMA thru
connector so you can still hookup your SLM or another drive. Incl DMA cable
and software. Everything you need to get going!

SYQUEST CART 44MB each in quantity of 3, no bad secs $ 20

SYQUEST CART 44MB no bad secs $ 30

SYQUEST CART 88MB no bad secs $ 34

SYQUEST CART 88MB quantity of 5, no bad secs except 1 cart $117

GOLF VIDEO VHS Improve Your Golf Game w/Richard Zokol, new shrinkwrapped $ 1

DAISYWHEEL PRINTER DaisyWriter 1500/2000 wide carriage, includes good $ 19
ribbon, has weird interface connector, seems to work but sold as-is

FLOPPY DRIVE 5.25" probably dead $ 1

FLOPPY DRIVE 5.25" tested, working $ 3

SCSI HDD Quantum Trailblazer TR84S011 840MB SCSI-2 drive, no bad sectors $ 55

SIMMS 1MB 30pin, quantity 4 sold together $ 6

ATARI JAGUAR game Checkered Flag (racing) incl FREE shipping $ 12

ATARI JAGUAR game Fight for Life (3D fighting) incl FREE shipping $ 12

ATARI JAGUAR game Iron Soldier (3D robot 1st person shootemup) incl FREE $ 13
shipping

ATARI JAGUAR video game console system mint condition, less than 1 year $ 54
old, lightly used, incl original boxes/manuals, A/C adapter, TV conv, 1
controller, with all 3 games

> then try to access your drive. Worked for me ;)

That's not it, Brian. I poked around and figured out why the Zip drive wasn't accessible if there was no disk inserted during bootup:

By changing the 'Maximum Sector Size' from 512 to 2048 in the 'Removable Media' dialog, I was able to use the drive even if no disk was inserted during bootup. From the start I always used the TOS/DOS partitioning scheme, but didn't update the maximum sector size for removable media (its default is 512).

Could this be related to your problem, David? Do a 'Get Information' on your FD-10 to see how many bytes/sector the disk uses, then match that size in the removable media dialog.

> IDE drives in it, if ya fiddle around a bit.

Well, my Falcon is far from standard ;-)
(http://atari.nvg.org/joevens_hardware.html)

> However other OS's may support more than 14 drive partitions,

Not only that, they support much larger partitions as well. Both MiNT
and MagiC supports FAT32, MiNT supports MinixFS and ext2fs as well.

Yoo Ron, ATB/B0 selects CCITT 300 or CCITT 1200 protocol once the command line prefix AT has been entered at the 300 bps or 1200bps data rate;

ATB1 selects BELL300 or BELL212A protocol once the command line prefix AT has been entered (usually a default setting)

Check out the Quick FAQ, and pay a visit to the Atari FTP sites.

For a freeware word processor, you can try Marcel, which also
reads/writes RTF. It also doubles as a text editor, but Qed might be a
better choice for that use.

Get lharc.ttp for lzh files, zoo.ttp for zoo files and arc.ttp for arc
files. There are also DOS versions of all of these decompressors. Check
out WinZip's help files about using external programs.

Don't know much about the Sportster but any other Hayes modem would
need ATW2 to report the DCE speed at CONNECT.

Using HDDriver 7.12 and MagiC 5.11 on a TT, I have to make sure there's a Zip disk in the drive when booting, or else I can't access it after one is inserted ("illegal drive").

It sounds like this isn't normal behavior -- indeed, a major inconvenience -- although it's something I've put up with under the assumption it was normal behavior for HDDriver. From your reports with an FD-10, a Zip drive should be able to do the same (not require the media present during bootup).

> place.

Maybe that could be the point. I prepared three partitions on a spare 105M disk: 10M TOS partition for Debian installation pack, 75M linux partition + 20M swap. Swap was initialized correctly, but the instal program wasn't able to initialize linux partition generating error messages (crashing at stack errors (?)). So maybe now I have the solution. I'll check everything and cry for help if there're any problems again.

Thanx for the reply

Stay cool,

Chris

Another I remember was "Stroker 64" on the Commodore 64. I will not go into details as to what the object of the game was, but it was interesting to note that the girlfriend of my roommate at that time did better at it than either of those guys. He later ended up marrying her. I wonder if her performance in the game had anything to do with it. >;)

>
>Cheers Jï¿½rgen

Hi,- no I don`t think it is that, the drive is not getting warm. At the moment it is in a bracket on top of the diskdrive, without the top of the computer in place.
I can touch it, it is cool.
But I am still getting some weird problems with some of my programs, that is, when running MagiC. And that is something that bugs me, I never have this kind of trouble on the smaller drive (the 130 Mb IBM).

It is either MagiC or HDDRIVER that is making this happen, as it is only with this big drive, and only when running MagiC, not in single TOS.
cheers

Joergen

Hi all!

Whilst preparing to post a question on StiNG (see next message!) I was
suddenly reminded of something I've always wondered about.

It's the Author line between the newsgroup line and the subject line of
the Post/Followup News box in Newsie. This doesn't come up when you email.

What exactly should I put in here (I've never used it)?

Cheers!

James

3251. STiNG DNS cache load failure

Newsgroup: comp.sys.atari.st
Date: 1999-05-22 00:00:00 UTC
From: jfhaslam@zetnet.co.uk
Message-ID: <3746af6c$0$10474@news.zetnet.co.uk>
Source record: 78298

Hi all!

I've recently upgraded to v1.20 of STiNG, and its all been working fine, until today, when I noticed "DNS cache load failure" coming up in the auto sequence. This has not been happening before now.

I've recently added Extendos to my Auto folder, as I now have a CD-Rom drive, but I made sure that STiNG is still at the end of the sequence.

What is the DNS cache? What does it do? I still seem to be able to use the Net; email, web and FTP seems unaffected.

Should I reinstall STiNG (or just the DNS part)?

Cheers!

James

They are all the same - the different letters indicate variations:

ST = Base model
F = Internal floppy disk drive
M = TV Modulator

L > I discover that MAGX.INF has disappeared. The partition has
L > been corrupted by something to the extent that where that file
L > was, is now a missing sector.

I don't know whether this will help, but hard drive sectors have
been known to go only _slightly_ bad, giving this sort of effect.
That is, a file works some of the time, and not others.

NB: I am not at all sure that this is a media problem - it might be
a single head (out of how many?) going bad. I have a drive that I am
all but certain that this happened to.

Diamond Edge has several routines to check for bad sectors, some of
them quite strenuous, which would tell you for sure whether
something is up (be sure to back it up first!)

Not sure what a DNS cache is...

>Should I reinstall STiNG (or just the DNS part)?

No,I just delete the DNS cache part as when you connect to the
internet again STiNG will create a new one.

Hi all!

I'm playing the above game on my Atari Falcon (I do know that it's available for the Jaguar, maybe on the Lynx??).

However, I can't work out how to get past level 10 (that's the one after the dinosaur level, where you have to sacrifice one dude to get to the last spear) coded "OLYMPIAN GODS".

There's a dude on the left hand side of the screen that I reckon I need to get enough dudes in a tower to reach the top. However, even if I get the spear to him to enable him to jump, he can't jump high enough to reach the next platform.

Anyone know the solution? Or failing that, does anyone have a list of level codes?

Cheers!

How wonderful that there is an interest in getting Atari computers
where they can be telnetted.

DarkChyld of Dark Forces might be able to shed some darkness.. I mean
light, on this subject since he as been considering it. I believed it
involved him getting a TT with ethernet card... but I'll let him talk
about it.

As it stands, the best example of Atari on the telnet is a BBS called
"Closer ot Home" which is actually an Atari 8-bit (emulated on PC) using
a new version of ExpressPro Gold that some programming working with
Video61 in Minnesota have been working on. This particular BBS went
online (telnet) in February of this year!

telnet://cth.tzo.com

Enjoy, and if you know of more telnetable ones... *I* want to know!

Wierd! Perhaps you could manually do the ATW2 and then save this
configuration so that it was picked up 'pre-set' by the comms. progs.
which use it.

Yep, I use a HP laserjet 4 plus printer with Calamus SL98. However I don't
use the driver as found in the package. I still use an old one,
hplaser4.cdt (2551 bytes, 27.10.92). IMHO it's better one.
I don't have experience with color separation so I can't tell you if this
work or not, but I don't see any reason why it shouldn't.

>No,I just delete the DNS cache part as when you connect to the
>internet again STiNG will create a new one.

Yeah this works ok. I thought that a reboot would create it, but no.

Cheers!

James

3276. FPU / Photline 2.30

Newsgroup: comp.sys.atari.st
Date: 1999-05-22 00:00:00 UTC
From: stevegreen@zetnet.co.uk
Message-ID: <37470c1d$0$10482@news.zetnet.co.uk>
Source record: 78323

Hi all, Bob wittered re the FPU and ?Photline 2.30. Delving into my carefully cataloged archives (ok, found an old ST Format review) i note two versions of the prog were released. Only one took advantage of the FPU, could be you're unlucky and have the FPU blind version. :(

By the way, how can you tell the speed of your FPU, is it obvious by external marks? Do you race it against someone else's FPU? Do you train it hard and peak at the right time?

Regards, Steve.

At the Neuss Fair in April we talked to Ulli Ramps and
he promised us that the English version has top priority
and that they have put a professional translator on the job.

Us i.e me and a group of Slowak papyrus users that wedre quieuing up
for the Papyrus 7.5 Office version. The latest version, however, is 7.57
that I got by email last week.

Gtx, Rein

P.S.

Beste Louis,

je leest toch ook wel het ACN-krantje??
Marc Drost staat ook op de verzendlijst
van R.O.M. Maar een Engelse versie zit er
bij hun niet in! Ook geen Nederlandse!

: power, and a Link II everything should work!

: Under ICD it does, under HDDriver it doesn't.

Funny you should mention it. A few of my problems are due to using a
TOS 1.00 machine, while my TT and its monitor are waiting for parts,
and that tos version does not understand hard drives very well.
With that tos version, and an old unix home drive, HHDriver works with
Link 97, and ICD Pro works with a Link. The converse is untrue.

Do think I found the same with an STE. Both are fine programs, but
somehow they seem to be picky about what version of Link you use. Not a
problem for me, since I have both, but it is a bit of a puzzlement.

Get yourself a link 97, and you can be as puzzled as I am.

My experience is that is mostly hard drive bearings that quit.
If you turn the drive upside down, it may work long enough to
move files off of it, or may even work for a very long time.

That has worked for me, twice, and it is simple enough to try.

It's used to... cache Domain Names, allowing a quicker response than
asking to the Domain Name Server (with the resolve module).

Neil,

Sorry, but no I don't think so. I have the maximum size set for the
Syquest i.e. 4096, and the SupraDrive FD-10 uses only 512.

Also, if that were the case, FD-10 would probably fail under TOS too.

Picking up Uwe's response, the FD-10 is obviously odd in some way, but
all functions work absolutely reliably under all combinations of OS
and HD Driver, once it has been recognized. Hitachi did market the
drive on which the FD-10 is based as a SCSI product for PCs, so it
can't be too unusual. I don't think the fault lies in the Supra
adaptor. I can plug the Seagate into the SCSI port on the FD-10,
rather than into the TT's SCSI bus and nothing changes - including the
SCSI level reported by the Seagate.

I don't think it's normal behaviour. I had never encountered it until
I upgraded to HD Driver v 7.61 (and I obtained v 7.71 in the hope that
it might cure the problems I have described, but it didn't).

In fact I have two removable media devices - three if I count the CD
drive. The second is a Syquest ezFlyer which is on the SCSI bus. I
normally boot up with a cartridge in that drive but in fact I do not
need to - the "illegal drive" syndrome affects only the SupraDrive FD-10.

It may not be relevant, but the v 7.71 Utility identifies the SCSI
level of a device. It reports '?' for the FD-10.

MEDIACHG will not bring the FD-10 to life.

Ahahahah yes this was it :-)
I had forgotten about those "features"..
But you must admit the gfx were good :-)
Any idea if this game is commercial?(although I some how doubt it..)
And any place I could grab it from? (for nostalgia reasons, ofcourse.)

Hi,

I have a USR 56k,v90,(FAXMODEM) and lable with barcode on the underside
says 'Sportster'. I get a full explanation of connect speed etc. using
the 'Init' set with ATZ and the dialing with a ATDT plus the number and it
gives all info at connect using STING. Maybe worth a try.

No, this is not normal. I never have encountered this problem with ZIP
drives or other removable media drives.

This means that the drive doesn't report any of the SCSI levels defined
by the SCSI standard. It's neither SCSI-1-CCS nor SCSI-2 nor SCSI-3. In
other words: It isn't compliant to any known SCSI specification.

My fault: I wasn't using the correct bytes/sector for removable media
(too low for TOS/DOS-partitioned disks).

From: John <john@mevatele.freeserve.co.uk>
Message-ID: <37466ECD.4D04@mevatele.freeserve.co.uk>
Source record: 78381

Hi there

I run an Atari ST BBS and want to get some info on Telnet.
I think its only possible to Telnet to a BBS that supports Telnet, is this correct ?
Does the BBS have to be permanently connected to the internet like a web server ? or is there some sort of dialup system ?
Is there such a thing as an ST BBS program that can be accessed via Telnet ? If not, are there any programmers out there who fancy having a go at writing a Telnetable ST BBS ? It would be like when ST Format gave away Michtron BBS on their cover disk, ST BBS's sprouting up everywhere!

Any info appreciated.
Please excuse the slightly rambling questions, I'm abit hung-over this morning :(

Cheers
John

You need to make a special floppy to have loaded at switch on. There
are a few progs. I can remember, COLDBOOT (ICD), NOROACH. They all
contain an adjustable delay - 10secs is usually about right for
spin-up.

You asked for suggestions. I have one.
To me it seems that when files are read during boot (at least when
the auto-folder is worked) that the system does not in any way check
the integrety of incoming bytes.
When a program is normally started and a readerror is done then
mostly you get a message of tos error -it is not a program-.
Not so ever when booting.
To me it seems: code is always executed and can lead to destruction
of data.

Met vriendelijke groet,
Ronald van der Kamp

Hi, if you want to run just games then I guess Pacifist would be very good. For Atari applications I use Tosbox and it is great. It runs Geneva , Calamus, PageStream no problem at all.
Installation only require to copy the tosbox files to the hard drive and then after loading the tb.exe just copy all your Atari files to c:/ (which is actually the folder whre Tosbox is in) and run like a regular Atari :)
To me Tosbox is quite perfect , stable and easy to use. You can use any acc or auto prg you use on your ST already.

Raymond
PS you can even run Tosbox from a single floppy on plain dos!

This is probably because you've got Connect (or a similar comms program)
open.

This happens to me under MagiC.

Though I don't have to reset. I exit the StiNG dialler, and then quit out
of Connect. Then once I reload the dialler, all is ok.

The reason seems to be that both programs initialise the serial port, and
if another program has done that, they baulk, because they want exclusive
use of the port. If I've done a BBS session with Connect, I always quit
out, before loading StiNG (and vice versa).

Cheers!

James

That would explain why I can still use the web, with this cache corrupted!

Unless you have a Falcon that is radically different than mine the above
disks won't even fit. You will need to find a 2-1/2 IDE drive which is
for a notebook computer and takes a different cable than the normal
3-1/2 IDE disk.

I have been using 3.5" disks for several years already, but then my Falcon
probably *is* radically different from mosts Falcons ;-)

>What is the DNS cache? What does it do? I still seem to be able to use the
>Net; email, web and FTP seems unaffected.

It's a local translation table which gives the conversion from the
'readable' URL (e.g. zetnet.co.uk) to the dotted quad form (e.g.
232.12.34.26) which is used in all internet addressing. The CACHE.DNS
allows for local translation of your most used URLs thus avoiding
having to query the DNS at you ISP.

>Should I reinstall STiNG (or just the DNS part)?

Just delete the (corrupt) remnants of CACHE.DNS and STiNG will install
and populate a new one.

Hi

I'll take it for granted that you are using a hard drive;p

This is why many people use a boot maintenance program such as Xboot,
Superboot etc. as you can disable programs and work out the one/s that
cause a problem.

If you have the hard disk driver disk you can do the following: switch
hard drive OFF and switch your Atari on; if you have a disk stick it in
the drive, if not wait until the desktop appears. Change resolution to
suit your needs and RUN the driver program from the desktop; if you
don't have the driver PRG file change the SYS extension to PRG (most
drivers work this way).

You should now have access to you hard drive WITHOUT running the AUTO
folder. Make your alteration and reboot.

I don't recommend this method as a standard routine, but it alright for
emergencies.

Get a boot managed such as Xboot and a directory sort program so that
you can alter the order programs are placed in ANY directory;)

I hope this gets your problem sorted;)

Hi

If you've got a STE or MEGA STE the answer is yes.

Further more the ST isn't very speed conscious and is possible to
install NON matching SIMM speeds. Ideally you should install the memory
in identical pairs (speed wise) in each memory bank.

->John
->.

Hi Johh. Well, this has been a very difficult subject for me. For about a
year now, I've been trying to get my BBS on the Internet, available by
Telnet as well. In my area, no ISP's offer accounts that have permanent
IP addresses (static) only dynamic. I don't know of any BBS software for
the ST's that offer Telnet capability out of the box. BTW, what software
are you using? I'm using BBS Express! ST v1.98a. I'm still trying to get
DarkForce! Telnet-able, but its gonna cost me quite a bit, both for start
up and monthly fees. Lemme give you a rough idea:

$200 initial startup for a dedicated line/IP address
$65 monthly fee for 12 hours a day ($140 for 24 hours a day)
2 more phone lines (I currently have 1 dedicated to the BBS)
to let users dial in by Telnet and direct-dial...

This of course, doesn't even include the cost of the computers,
modems, etc,... So you can see, its not something to take very
lightly in my area... Oh, did I mention that its LD to call this
ISP as well? ;-(

I know of one 8-Bit BBS that is available by Telnet, but they are
running it via emulation (I think) on an PC machine... Oh well...

Let me know if you find an easier/cheaper/better way to make an
Atari BBS available by Telnet! ;-)
```

Catch ya later...

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi, all.

I've got this 21 (I think) inch black/white monitor today, but I don't have any information about it whatsoever. The ones I got this monitor from thinks that is is possible to use this monitor with the TT, to get to TT high res. Since I don't have any info about it, I ask here :) The monitor type;

Cornerstone DualPage monitor - model M/10720

This was the info I found on the back of it, and on the front it says;

ND Comtec

So, if anyone have any info about this thing, please don't hesitate to let me know. I have tried to search the web using altavista, and found a lot of Cornerstone DualPage monitor's but not one with the above model number. Any info on this is most appreciated..

Thanks.

Odd Skancke - ozk@atari.org

You know what I mean! They're all the same computer but with
different add-ons! Now the 1040STE *was* a different machine. For the
original poster of the question, the "E" stands for enhanced. It had
all the add-ons listed above, but was also a revamped machine,
containing different audio hardware, operating system, and other
things that I can't quite remember.

: P�l Monstad

I find this hard to beleive with such programs as GEMTrade that will even translate a German web page through CAB while you are on line.

Perhaps ROM Logicware is fishing for direct sales of this product to English speaking countries or are looking for another way to get English translations done with a lower overhead.

I have talked to Danish users who have translated programs (Papyrus 7 in particular) into english for their own use.

>
There's a tip that might be useful. If you have a floppy or CD of your
modem with window$ installation infos, you could take a look at the .inf
file. It contains several settings like:

HKR, Init, 2,, "AT&F&B1&C1&D2&M4&K1E0Q0V1&A3<cr>"
HKR,, Reset,, "ATZ<cr>"
HKR, Monitor, 1,, "ATS0=0<cr>"
....
[Fast]
HKR, Init, 2,, "AT&F1&B1&C1&D2E0Q0V1&A3S0=0<cr>"

This file doesn't contain any W(0,1,2) command, so it should be a register
setting or another AT command.

Actually the above is from win95 mdmusrcr.inf file, but you should try
the one that came with your modem, using CoNnect or even a PC to do it
for you and then save the settings in the modem's EEPROM.

Regards Vassilis

>Is your termination OK?
>Do you trust the bus cable?

Yes,- I trust the cable, it`s the internal one I use with the other drive to. About 6 inches
long. It never gives any trouble with the 130Mb drive.
BTW, I like to have a cable with connections for 2 drives, but so far I haven`t been abel to
find any with 44 pins.

I`m not to certain about the termination. I don`t have any jumper on this drive. There is a small scematic drawing on top of the drive, showing how to set the jumper for Device 0, Device 1 and something I don`t know about, but it says Cable Sel on the drive?

This scematic shows, that for Device 0 there is no jumper, for Device 1 there is a jumper on
pin 1 and 2, and for Cable Sell a jumper on pin 2 and 4.

As I only have 1 internal drive, I don`t have any jumper on it. I did try to set the jumper on my first try, but non of my software was abel to see the drive then. That was before I had discovered that little drawing, and naturally, when I removed the jumper, it worked right away. And it did work like a charm for some time, then all kind of trouble came up.

I really don`t get it, at first I just copyed all files from the old drive, and everything worked fine. But not anymore.

cheers

Joergen

Sounds like you don't have the LBA stuff working on the hardrive. You'll still
boot with a hardrive
but will get erratic errors. Maybe you accidently disabled it. Hehe. I've done
that on my PC.
Had problems very much like yours.

Hope that helps,

Bill

(PNP) ($20)

Cards:
Micro speed bus card - for bus mouse and trakballs - ISA ($15)
IK 2nd&3rd Par port card - ISA ($20)
IK 3rd&4th HS serial card - ISA ($20)
(4 each) KW Multi I/O 16bit cards - ISA ($8)
Promise IDE & Floppy Cache controller w/4 of ram (uses simms) - VLB
($25)
IK Multi I/O controller card - VLB ($15)

Scsi Cards:
Adaptec AVA-2902I scsi 2 internal only controller - PCI (PNP) ($50)
16 bit scsi card external only - ISA (PNP) ($20)
Adaptec AVA-2940 scsi 2 - PCI (PNP) ($70)

Memory:
(25 each) 256k memory chips 16pin dip (make offer)
(11 each) 1meg 30pin simms (make offer)
(8 each) 256k 30pin simms (make offer)

Switch Boxes:
HD15 AB switchbox 2 position - for VGA/SVGA monitors ($10)

Keyboards:
Gateway 102 key - ps/2 style ($20)
HP 102 key - ps/2 style ($20)

Monitors:
CTX 15" digital svga monitor 1280x960 max res - (PNP) ($95)

Computer systems:
(2 each) Pentium 133 w/32 meg ram, 2 gig ide HDD, 3 1/2 floppy, mid
tower AT case, 101 keyboard,
mouse, no video card - ($100)

Compaq Presario 4860 333mhz Pentium II w 64meg ram, 2 gig IDE HDD, 3
1/2 floppy, DVD rom,
ATI Rage pro video (DVD playback and video capture), PCI
sound,Internal 56k modem, Mouse and
keyboard - Complete system ready to go with Win95 ($600) (check
Compaq's web site for a complete list of details)

Pentium 200mmx w/96 meg ram, 2 gig IDE HDD, 3 1/2 floppy, full tower AT case w/ 5 1/4 drive
bays, 101 keyboard, mouse and SB awe32 with 4meg ram - Complete ready to go with Win95 ($200)

Other:
Viking DLE-200a ring down unit
(5 each) Windows95 full OEM version CD's w/ manuals (sealed) - ($30)
(33 each) Windows98 full OEM version CD's w/ manuals (sealed) - ($45)
(7 each) Microsoft Home Essentials Software Bundle (sealed) - includes MS money,
Encarta 98, Word 97 and Hallmark greetingcard software - ($25)

PRINTERS:
Apple laserwriter IINT 300 dpi w/ extra paper tray & 4 toner carts, has serial & appletalk
interface. Unit has been reconditioned and motor has very low usage ($100)

Atari 8 bit:
Signalman 300 baud modem for Atari 8bit - for collectors ($20)

Atari ST Stuff:
(2 each) Mega ste/TT power supply - ($10)
Atari 520 STF with 4 meg ram, mouse and replacement keyboard - ($35)
Migraph hand scanner and cartidge (no software) - ($10)
(2 each) External SF354 720k floppy drives with power supply - ($8)
Atari TT030 with 2 meg st ram and 2 keyboards (unit needs work or use for spare parts.
Unit boots but does not see HDD, it may just be bad and has 1.44 floppy installed but not
floppy chip to support it.) - AS-IS ($45)

Atari Falcon030 no HD w/ 16meg ram, FPU, mouse, extra C-Lab replacement case, vga and
sc1224 adapters - ($150)

Amiga Stuff:
Amiga 3000 desktop, 6mb ram, 40 meg Hdd w/software, Keyboard, Mouse - ($100)

T h i n g s I w o u l d l i k e

Atari Jaguar stuff, Atari Portfolio stuff, Sega game console stuff, Gameboy stuff.

If you want to do cash then email me and we will work things out for shipping,
Average price for shipping is $5 to $7 for smaller items.

Hallo Vassilis!

VP>Might take some time, but at the end you'll get the best results for
VP>your setup.

Well, I might get these results, but not before my next holidays come. From now on, Milan and Falcon #1 are located here in Bubenreuth again, whereas Falcon #2 will stay in Ahornberg. And there are some 120 kilometers in between, slightly too far away for my midi cables ;-)

mit freundlichem Gruï¿½ aus Bubenreuth

Ekkehard

Some Bavarian geografy:
Bubenreuth: Small town approx. 4km north of Erlangen, which itself may be found approx 30km to the north-west of Nï¿½rnberg.
Ahornberg: Small village, approx. 15km south of Hof, which is located 150km north of Nï¿½rnberg.

Yeah, time to hit reset.

>I that the
>number of bombs you get denotes what sort of error it is, but I have long
>forgotten!

They do but there aren't any errors defined for this many. It'll be a
case of multiple crashes. Basically the system has been scribbled on
so bad it can't even recover after issuing the initial amount of bombs
so it promptly bombs again. After a while it'll get so bad the
processor will usually halt itself.

>It happens to me when I use Pacifist to play Championship
>Cricket from the Automation CD11 (or rather the disk image of it), and I go
>to play a County Championship game. Anyone else expirenced this and is
>there anyone who knows how to solve it?

Ah, if the game runs okay on a real machine (or even just bombs more
"reasonably") it is likely you've encountered an inconsistency in the
emulator. Good be worth a bug report?

>No windows application!!!

Don't bet on it. It's a Win32 console app. Won't run under DOS 'cos
it's all 32 bit code.

>After compiling about 143.000 lines!! I ended up with a .exe about the same size
>in bytes.
>But it worked!

And even better when you start fiddling with options you can whittle
it down to 7K!

I must admit BCB is growing on me, whereas I took one look at a VC
windoze app and thought ... well the 'f' word and 'that' about
describes it.

>I think one can have the complete MSDOS kernel linked in that amount of bytes.

I think 7K for the MSDOS kernel, considering its performance, is
definately bloatware. ;-))

This is a little late, but I just thought I'd put it in. I've written PDF files on my Atari. I design the page in PageStream, print it as PostScript (although, I have to reverse the orientation (if I want a portrait page, I have to print it landscape <shrug>). I then load the PS file into Ghostscript 1.2 - to print (to disk) a PDF file, just select "Ausgabe". Under "Ausgabe auf", select "Datei:", under "Ausgabegerat" select "pdfwrite". It seems to work fine, I've used it a couple of times recently to send PDF copies of my resume.

Sorry if this has already been answered, I haven't been up on c.s.a.st in a while.

Hi,
have you looked in the text file for Brian's address and tried asking him directly, from what I remember of my dealings with him about Routfinder he spends a lot of his time working out of the country and so both any replies to letters sent to him or updates will take a while.

I have an unregistered copy of V2.1 Brian sent me the last time I wrote to him, as far as I know it was the last update, if anyone knows differently I would be interested to know/obtain a copy to see how up to date the maps are with respect to some of the updating to the maps I have done.
I have made meny updates to my maps and have also kept a note of them, I am currently in the process of sorting them into several files. Once sorted I will make the files available for downloading from my web site so that other Routfinder users can use them to update their maps, some of the files will contain hit's, tip's and suggestions on ways of expanding the progammes use without it neeing to be re-written.

So as you can see I am semi-supporting Routfinder and a third party capacity, if anyone else has already done or is in the process of doing anything similar to this plaese mail me so that we could share notes/ideas.

```
CuBase Question.
==============
I have a freind who has just purchased a CD writer for thier PC but the
software supplied does not allow them to edit the music/data just copy and
store it.
Am I right in thinking that Cubase Audio allows you to edit the music and
that there is a version for the PC?.

Games for Trade.
==============
I have the following ST games for trade...

Dragons lair.
-----------------
Excellent almost cartoon quality animated graphics are what make this
Don Bluth game, close up you can tell it a computer animation but from
a few feet back you would think that your watching a real cartoon.
Game play is limited to finding the correct timing and combination of
Joystick movement and fire button that control Dirk's movements.
If you have not seen a Don Bluth game then it's worth a look,
considering that when it was released it cost £45 it's a steal.

Dog fight. 1MEG Required
---------------------------------------
Microprose flight sim.
Fly planes from WW1, WW2, the Falkland, Vietman and Korea either with
in their own time zone or planes from any era against each other in a
one-on-one dog fight.
Try shooting down a Harrier from a biplane or visa versa, it's not as
easy as it may sound.

Leisure Suit Larry 2
---------------------------
Adult Graphics adventure
*** Box contains Parental guidance warning ***

Frontier - Elite 2. 1MEG Required
-------------------------------------------------
Do I need to say any more.

Corporation.
-----------------
3D first person adventure/shoot 'em up. Use weapons, ID cards,
computer terminals and more to discover the truth about the
Corporation.
```

Battle Command.

Your tank is parachuted into enemy terratory from a stealth helecoptor,
can you compleate the mission and make it back to the pick up before
being destroyed.

M1 Tank Platoon.

Microprose Tank sim.
Fight in summer and winter, both day and night to defeat the pact
forces.
Control your tank from one of 4 positions (driver, gunner, commander
(battoned down), commander (riding on top)) and give orders to you
whole platoon and to any support units your given (extra tank units,
moblie missile launchers, recon and attack helecoptors, A10 tank buster
planes and artillary).

All games are complete with their origional disks, manuals and boxes,
all in excellent condition and have been virus checked using the
Ulitmate Virus Killer V6 and found to be clear.

Rather that see them tossed into the bin I will part with them in
exchange for 2 Minidisks per game, TDK MD-RGX74 Minidisks preferred.
This covers the cost of both the Game and Postage/Packaging.

Or three Games for 5 disks (Box of 5 Preferred).
Or 10 Disks for the lot (2x Box of 5 disks, or 1x Box of 10 Preferred).

The cost for the specified TDK MiniDisk is £2.50 to £2.80 each or
£12.00 to £13.00 for a box of 5.
MiniDisks are available from all good Hi-Fi/Music outlets,
Dixons/Curries, Robert Sayles and Argos.

Free *Free* *Free*
Free to anyone in the UK/europe who wants them two 256k SIMM modules
used to upgrade a 520 ST/STE to 1Meg.
Plugs into SIMM sockets on STE motherboard or Memory expansion board
fitted to an ST (eg Marpet Xtra-Ram)

e-mail me at sgm23@eng.cam.ac.uk to confirm availability.

Every now and again there appears some truly valuable info on the NG and your's is one. I have the Full PageStream 2.2 package at home (typing at office), so can not check, but have a feeling that PageStream can not handle embedded images in Postscript, something about having to have a separate file. Am I correct. Even if I am your info. extends the use of our humble Atari. Thanks.

The latest GhostScript GEMGS is a first class implementation. I have displayed and printed some full colour adverts on the Falcon with it, albeit with a 1000:1 speed reduction from Adobe, but at least it can do it! The PDF help file that goes with the demo of DA's Layout defeats it however!

Bob King.

Hi there!

I thought that Stik and Mint weren't compatible, so maybe thats the
problem?

Anyway, most hard disk drivers allow you to hold down a key whilst booting
to bypass the Auto folder. Usually it's Control, but it might be Alt or a
combination of Ctrl, Alt and/or Shift.

You might have to wait until your hard disk driver appears on screen
before pressing the key(s), experiment.

Cheers!

Hi all!

Does anyone know of a site where there are tips and cheats for Atari ST/Falcon games?

I'm especially looking for level codes for Evolution Dino Dudes on my Falcon, but having done a web search, all I can find are the Jaguar version's codes (they are different).

Also I'd like to find out if there are tips for the Falcon version of Pinball Dreams.

If there isn't such a site, I would like to start one, as part of my website. What do people think?

Cheers!

James

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.20 for the first game and $1.10 for each additional game. Shipping for hardware and accessories depends on weight/distance. Large orders will be weighed as a package, to reduce shipping costs. Foreign orders welcome.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I

collect for over 50 different systems, so please feel free
to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping
costs. Shipping cost depends on both the weight of the order
and the distance that the order must travel, unless a set
amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't
serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly
listed. There is no minimum order.

7) If you have a problem with the listed price, please remember
that nobody is forcing you to buy from me. I have been in
business since 09/05/93, so I have a good idea how to price
items. My personal philosophy is that something is only worth
what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order
-drawn from a U.S. bank branch-, or cash. Orders from outside
the U.S. are also accepted (also, please check out my want
lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to
correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are going to follow through on your
order *BEFORE* you place it,
3) next e-mail me a list of the items that you are interested in
(please quote from the FS/T message, but not the entire thing!),
4) also include your full name and full postal mailing address (this
information is for internal VGA use only, and is REQUIRED!),
5) I will reply with a shipping information message for your order.

Thank you!

> I've got this 21 (I think) inch black/white monitor today, but I don't
> have any information about it whatsoever.

The TT has an ECL type output. Question is what's the expected input for your monitor? VGA, SVGA, ECL, CGA etc? Also, it is likely that your monitor requires one specific and precise H-sync and likewise V-sync value. The chances for the coincidence of the TT's sync outputs and for the inputs of the Cornerstone monitor are slim. Most likely you would need some kind of graphic card for this to happen.

Suggestions: Try to find out what company really made the monitor. The badge doesn't necessarily have anything to do with it! For instance: The Atari TTM194 is in reality made by an american company called Moniterm, it appears the TTM194 is in fact a somewhat customized Moniterm Viking. The Atari TTM195, similar in outlook to the TTM194, is made by Philips in Canada.

I have in my possesion a Sun monitor made by Zenith and another one made by Sony.
Both of these only sport the Sun badge.

After you've found the real producer you can more easily find info about your monitor on the Internet.

Attaching a non-Atari monitor and expecting the TT-high resolution is unrealistic. At least without a dedicated graphics card.

With a little luck, provided you have a graphic card that fits your monitor, you could make the monitor work . Probably you'll have better chances on a PC with Linux.

MG

Yes, I know that TT has ECL type output. I have no idea what this Monitor
requires, or what type of input it needs. I do have a card for the
monitor, but I don't have any drivers, no info whatsoever...

I'm pretty sure this monitor is produced by Cornerstone, and I have
searched the web for the model number, M/10720, but I can't find any info
about it.

>
> Attaching a non-Atari monitor and expecting the TT-high resolution is

Yes, I think so too.. but since the person I got it from meant that it
can be used with the TT somehow, I though I'd search/ask for info, but
so far I'm not any wiser :)

Before I go hog wild on my own, I would like some advice as the st is new to me.

I have a Mega ST4 (4mb), TOS 1.04 , an ICD Link II scsiface, an external (of course) 9600 v.42bis modem and would like to multitask and surf the net.

I don't want to spend any money on software as my old lady would kill me. I already have 32 computers in the house and shouldn't really be spending more..... ;-)

I have run Mint .95 for some time but I gather there are later versions than this. What is the best freeware multitasking environment for the ST? Where do I get it? Will it allow me to run my scsi cdrom as did mint .95? What about a browser/ppp setup? What is required?

2. WHAT WILL IT COST?
3. EXHIBITION
4. SEMINARS
5. OTHER ACTIVITIES
6. GENERAL RULES AT THE SHOW
7. WHY SHOULD I ATTEND NAS?
8. HOW YOU CAN FIND OUT MORE

Dear Atari friends,

It's once again time for the Nordic Atari Show, the annual get together
which has rapidly become a fixture for all Atari users.

We arrange the show for the fifth straight year we hope to fulfill
everyone's expectations and that this will result in the best possible
atmosphere.

In den letzten 5 Jahren ist die Nordic Atari Show zu einem festen Event
in der TOS-Szene herangereift, der mit jedem Mal besser besucht wird.
Austragungsort sind die Rï¿½umlichkeiten des Guttempler-Ordens Gï¿½teborg
in Schweden. Veranstalter ist die Swedish Atari User Association.
Gesucht werden weiterhin Atari-User, die Vortrï¿½ge zu bestimmten Themen
halten mï¿½chten.

1 - WHEN AND WHERE?

This year the show will begin on Friday, June 11 and end on Sunday,
June 13. This is the weekend following the beginning of the summer school
holidays as well as the weekend prior to the Swedish Midsummer
celebrations. We'll open at 10 p.m. on Friday and close at 6 p.m. on
Sunday.

NAS99 will be hosted at the IOGT-NTO (International Organization of
Good Templars) quaters located in Gothenburg and between two places called
Jï¿½rntorget and Masthuggstorget, just where the Stena Line ferries goes towards
Denmark.

A map for the route description at http://www.sak.nu/nas/find.html

2 - WHAT WILL IT COST?

If you intend to attend all three days, you cheapest solution is the
Three Day Pass otherwise a Single Entry ticket will do:

* Three Day Pass ... SEK 100:-
* Single Entry ..... SEK 60:-

These prices include full access to all the activities being held during
NAS99.

3 - EXHIBITION

The exhibition hall is open:
Friday 11-20, Saturday 11-20 and Sunday 11-18.

At the exhibition you can see:

16/32 systems (England)
Nic Harlow has always been at NAS, so why any different this year?
He's sells CD:s for Atari, games and more.

SAK and SAK/Skane
The Swedish Atari Users' Association and the local department in Skane are
here too, to show different programs and computer systems in action.

4 - SEMINARS

Last years seminars were very much appreciated, something of which we
naturally have taken notice.

The SEMINARS will be held from 12 p.m. on Saturday

- Erik Hï¿½ll the author of MyMAIL describes the ethernet network part on NAS,
how the computers are connected and the system software running, such as
the Apache server installed on a Hades.

- Jonas Mï¿½ller Nielsen about MiNT/MiNTnet

- Kenneth Medin describes how his sub-net with Atari TT030 and Mega STe are
serial connected to the main network.

Martin-Eric Racine will cooperate and show how he connected his TT030, iMac and Stacy to the network as well.

- Mille Babic present how to create a webpage with the brand new Homepage Penguin Pro 3 by M.u.C.S

5 - MORE ACTIVITIES

* A very large network called Erika will be set up with several Hades machines, SUN workstations and Linux platforms. A apache server is installed in one of the Hades machines with a Internet gate.
Two sub-nets called Pia and Soumi with a TT030s, Mega Ste, iMac and Stacy also connected.

* Minor competitions such as "A-Z on the Keyboard" (a much appreciated contest last years), hard disk throwing (this year it WILL happen!), network games, juggling, etc. Everything depends on our finding volunteers to act as game leaders and referees. There will be prizes for the winners.

* A refreshment stand will sell non-alcoholic drinks, sweets, chips, etc.

6 - GENERAL RULES AT THE SHOW

* No smoking inside the building or by windows and doors.

* No alcohol, beer or anything like drugs will be tolerated inside the show. Please have fun with that outside in the city, but not at NAS99. All such things found will be confiscated, we are at IOGT-NTO as well.

* Keep a good attitude against other people and show your tickets to the staff if asked for it.

Anyone breaking these rules or acting violently will be thrown out of the show.

7 - WHY SHOULD I ATTEND NAS?

The Atari market now contains better apps and system software then ever before. We have seen that the TOS-compatible machines Hades and Milan actually was successful. Last year we could demonstrate a Milan computer days before it was released and this year we are up to show a Milan with MagiC Milan 6.1 installed.

We think that you care about the TOS platform and that you will visit us not only to walk around but share your experience with us. If you are from the Scandinavian regions then concider that NAS is the only Atari show this year in Northern Europe.

NAS is for all of us a opportunity to gather, together for a few days and let us know each other in person then electonically.

8 - HOW CAN I FIND OUT MORE?

Information will be distributed regularly in the same way as this text file. In addition, we have a number of other sources of information where you can find out more about the show depending on your own resources.

* Our home page on the World Wide Web. This has been in existence since last two years and we'll try to update it as often as the information comes. The home page will contain more detailed information concerning times, schedule of events, directions on how to get there, competitions and housing.

The addresses are http://www.sak.nu/nas and http://www.sak.nu

* STraight BBS. This is the Swedish Atari Club's home BBS. Information concerning NAS will be included in the SAK menu. You can also use this BBS to ask any questions you may have. The telephone number is: +46 (0)31-336 39 73.

* The first issue this year of our club magazine "Atarimagasinet", will be released at the show.

* Our show co-ordinator is this year as well as last year, Mille Babic. He's supposed to know everything there is to know about NAS99. If you have questions to which you've been unable to get answers anywhere else you can send us a message at nas@goteborg.utfors.se or to Mille at mille@atari.org

All members 1997- will also receive welcome info about NAS and the status of the club.

KEEP THE TOS PLATFORM ALIVE.
WE ARE LOOKING FORWARD TO SEE YOU AT THE NORDIC ATARI SHOW 1999!

Best Regards

Mille Babic

Hi all!

Now there is just a few weeks to our Atari show here in
Gothenburg. If you think you have something that will have
a Atari interest, then do not think twice, just show up
here. A GEM app, a game, a networking solution, a new
version of a program, hardware enhancments, anything...

This is as I always says, the only Atari Show here in
Scandinavia and I think the market or shareware authors
should have a interest in this.

The thema is Atari & Network, we are going to build up
a ethernet network, mostly with Hades machines and two
subdomains for Atari originals. If you have any interest
in networking with STinG, MiNT etc then this would be
your lucky days and ours, if you show up. We have also
plans that this network will have a Internet connection,
thus one of the machines have apache server installed and
all of you that can not show up could connect to us and use
services such as http, telnet and ftp.

There is lots of accomodation possibilities here in
Gothenburg and if someone of you just have to visit us
as cheap as possible, then we might find a place for you.

Best Regards

Mille Babic

Hi

By that comment, I thought I'd already tried and addressed your
suggestion. Nothing negative was meant by the answer:)

Thanks for the input;)

This is easy - MiNT is the *only* freeware OS for the ST, atleast as long
as you need to be TOS-compatible. The latest MiNT-stuff can be downloaded
from most popular ftp-sites, but I believe ftp.funet.fi is one of the more
up-to-date.

Can anyone help please?

I have tried without success to un-Zip files downloaded from Internet and FTP sights. While the Zip files 'appear' to download without problems I can't extract the files without the error message 'ST Zip- Fails CRC Check' showing against some of the files during inflation.
If I try to run the resulting Prg file then I get TOS Error #35.
I have however been successful previously in obtaining Zip files from BBS sites.

Another problem I have is that I usually get three bombs on initial boot-up and I need to power-down briefly to get my system operating on the 2nd attempt which always works! It dosn't seem to make any difference if I boot from Hard or Floppy drive

Do I have a Hard drive problem which is also affecting the first problem???

My system is 4Mb Mega STE with internal 105Mb HD

Hi all,

One of my pupils has a Falcon + 14" monitor for sale. I'm a bit unsure of all the details but I think it is a 4meg. (I don't have access to the machine at present).

The owner lives in Cambridgeshire, UK and if you mail me direct I can put you in touch with them. Asking price is UK200.

Cheers

Paul

Hallo!

I have been trying to get a STE-machine(2Mb) to work
with a HD (Maxtor ACSI), but every partition
disappeared as I tried to save something. (Luckyly it
did not matter as it was all old useless stuff.)
But connecting the HD to another STE(4Mb), made it all
work perfectly.
Why?
Is it possible to usa a patch to avoid the trouble, or
is it a hardware problem?

>You try it for yourself.

Uli Ramps was promisng a long time a TAF member (Harvey Wolfe) that he
could test out a beta of Papyrus7, but nothing came of it.
From my understanding (apologiST?) ROM apparently upgrades the *.rsc
file so often it makes it difficult to pick a "version' to translate.
I was told many times that an English version of Papyrus7 was on its
way. now it is at 7.5! :-(
I finally gave up and bought Papyrus 5 from HiSoft.

I guess it is a DMA-chip problem. Several STEs have this problem, and I know
a lot of them seams to be around in Norway. I know because I have replaced
the DMA in about 20 machines during the years. The faulty DMA chip can be
located by opening the machine and searching for the chip which is found
under the disk drive. I can't remember the number and text on the chip, but
I will search in my manuals if required.

I run Binkley as a BBS mailer, and if I try to use Sting without a
reset I get that.

>all i can do then is do a reset.

In my case I know whats causing it, Its Binkley that doesn't clear the
port for anything e;se to use it, it even does the same to Fiz Diz,
that won't work if Binkleys been used without a reboot.

I would presume you may have used asomeother comms software that is
doing the same.

Yes you can mate, as long as each bank has ther same type of chip it
will work.

Just put the other 2 chips in the 2 remaining slots should do it.

If its an STFM though I think you will have to disable the internal
memory.

I have now crawled all over my hard drives looking for bad sectors. I did not find any and, I must confess that, given the behaviour of the software, I did not expect to find any. Let me state again what that behaviour is.

On at least 50% of occasions, the computer will freeze while booting from switch-on to Magic 6.01 using either version 7.61 or 7.71 of HD Driver. Often, but not always, one of the floppy drive lights comes on as it freezes. Sometimes the boot will get as far as the desk-top appearing and I am able to complete a couple of actions before the TT freezes. But if I survive that far, the operation of the computer is the completely reliable.

If I replace v 7.(6/7)1 with v 7.00 this problem disappears, absolutely.

The computer never hangs when booting to TOS 3.06 with v 7.61 or 7.71

All the evidence suggests that, at least with my combination of hardware, there is some random instability in the combination of the most recent versions of HD Driver and Magic 6.01

|module in the printer if you want.
|maybe it has something to do with memory, perhaps i need more printer
|memory, as I have problems with Pagestream printing out half pages.

I really do think that 'p' is for personal. They do/did make an 'm' version of some of their printers (for use with Macs?) which were possibly postscript compatible.

In Papyrus 5 under Compatability there is an entry for Printer Imaging - 'Use screen drivers/Use MEMORY.SYS drivers'. I think it is this which you change if you are in an Atari colour mode (medium res say). It has nothing to do with the actual colours you are printing. I have 'Use MEMORY.SYS' selected because in the Hades I cannot find a monochrome setting for my large screen monitor.

You might also have a problem with printer memory. The new laserjets have some sort of memory compression, the older ones need more memory - I have fitted a couple with extra but I don't remember how much. 2 meg ought to be sufficient.

3421. update on monitor problem

Newsgroup: comp.sys.atari.st
Date: 1999-05-24 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <37499da4.0@diana.idirect.com>
Source record: 78243

thanks for the advice. I'd gotten similar advice from Derryck Croker at Cheshunt Computer Club and from David Encill at Core/BSS (who produce Videlity).

Unfortunately, it's not working. Videlity has a "preview screen" function built inside its configuration program, and I have no problem seeing the preview screen for TrueColour sync up properly, so the monitor can handle it. It's at bootup that's causing the problem - as I'm noticing, the monitor goes through bootup properly, but then when the desktop portion comes up the screen goes completely black and the LED light turns yellow (which indicates that the Energy Star function turns on according to the manual).

The funny thing is - I got a small AUTO folder program with my Nemesis accelerator board (also by Core/BSS) that gives you a 640x480 TC screen - this one actually works. Now if I only know what the specs are for hZ setup I might be able to figure out what's going on.

I remember that I've had a similar problem about two years ago when I first got my Nemesis; we were without our video tablet at the TAF meeting where I was giving a demo of it, so we rented a digital SVGA monitor for the night from a computer dealer down the hall from our meeting place. Videlity choked on the monitor in TrueColour, but the HRTC program worked like a charm. My new LG monitor is also digitally controlled - could there be a connection? (My previous monitor, a Hyundai SVGA that was NOT digitally controlled, handled a 736x544 TC screen nicely - I got rid of it because of my concerns regarding radiation coming off it, and it couldn't handle larger, lower colour screens without having to go to the back of the monitor and tweezing it with the knobs).

In any case, I'm very pleased with my LG - it's a nice clear 15" screen, and it digitally saves my screen sizes so I don't have to twiddle with knobs. I'm now working with a really nice 800x608x16 screen as my main work screen now (Videlity works well at this mode) and I use CAB in greyscale mode nicely. But I would like to have a higher-res screen again for CAB work (640x480 is good for looking at photos, but really stinks at displaying at CAB, as the fonts look a bit blocky)

Anyway, maybe this additional info may give you an idea what is going on. Maybe a member of your club also has a digitally controlled monitor hooked up to a Falcon?

Computer systems:
(2 each) Pentium 133 w/32 meg ram, 2 gig ide HDD, 3 1/2 floppy, mid
tower AT case, 101 keyboard,
mouse, no video card - ($100)

Compaq Presario 4860 333mhz Pentium II w 64meg ram, 2 gig IDE HDD, 3
1/2 floppy, DVD rom,
ATI Rage pro video (DVD playback and video capture), PCI
sound,Internal 56k modem, Mouse and
keyboard - Complete system ready to go with Win95 ($600) (check
Compaq's web site for a complete list of details)

Pentium 200mmx w/96 meg ram, 2 gig IDE HDD, 3 1/2 floppy, full tower AT case w/ 5 1/4 drive
bays, 101 keyboard, mouse and SB awe32 with 4meg ram - Complete ready to go with Win95 ($200)

Other:
Viking DLE-200a ring down unit
(5 each) Windows95 full OEM version CD's w/ manuals (sealed) - ($30)
(33 each) Windows98 full OEM version CD's w/ manuals (sealed) - ($45)
(7 each) Microsoft Home Essentials Software Bundle (sealed) - includes MS money,
Encarta 98, Word 97 and Hallmark greetingcard software - ($25)

PRINTERS:
Apple laserwriter IINT 300 dpi w/ extra paper tray & 4 toner carts, has serial & appletalk
interface. Unit has been reconditioned and motor has very low usage ($100)

Atari 8 bit:
Signalman 300 baud modem for Atari 8bit - for collectors ($20)

Atari ST Stuff:
(2 each) Mega ste/TT power supply - ($10)
Atari 520 STF with 4 meg ram, mouse and replacement keyboard - ($35)
Migraph hand scanner and cartidge (no software) - ($10)
(2 each) External SF354 720k floppy drives with power supply - ($8)
Atari TT030 with 2 meg st ram and 2 keyboards (unit needs work or use for spare parts.
Unit boots but does not see HDD, it may just be bad and has 1.44 floppy installed but not
floppy chip to support it.) - AS-IS ($45)

Atari Falcon030 no HD w/ 16meg ram, FPU, mouse, extra C-Lab replacement case, vga and
sc1224 adapters - ($150)

Amiga Stuff:
Amiga 3000 desktop, 6mb ram, 40 meg Hdd w/software, Keyboard, Mouse - ($100)

T h i n g s I w o u l d l i k e

Atari Jaguar stuff, Atari Portfolio stuff, Sega game console stuff, Gameboy stuff.

If you want to do cash then email me and we will work things out for shipping,
Average price for shipping is $5 to $7 for smaller items.

True the 2.5" disks are a perfect fit, but 3.5" disks can also fit.
The trick is to remove the internal (infernal!) speaker and mount
the disk 90 degrees around from the direction the 2.5" disks fit.
Make sure the connectors are at the PSU end...You may need to
mess around drilling holes in the 2.5" IDE mounting bracket but
that isn't much bother really...the bonus is that the silly wee
internal speaker no longer sits there making horrid noises!!!!

You of course also need a 44 -> 40 pin + power interface adaptor
plug. System Solutions have these for less than 10 quid...they
plug onto the motherboard IDE connector and turn that from a 44-pin
mini IDC conector into a 'standard' 40-way IDC connector + 4-way
12/5V power cable to power the disk...easy as pie...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

> and i have the horrable sound again :)

I'm surprised you would keep the speaker!! :)

Also, how close is the speaker magnet to the drive casing?
The speaker isn't a 12" subwoofer but it is still a magnet...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

> Falcon030, 14mb ram, 540mb hd, 17" svga monitor, MagiC, Pagestream, NVDI,
> ExtedDos Pro, ICD HD utilities.

It doesn't...you will likely have to drill some holes in the bracket
to be able to screw the 3.5" disk on somehow...only one end of the 3.5"
disk sits 90 degrees about on the bracket...the other half sticks out
towards the floppy disk drive. The internal speaker would otherwise be
in the way so you need to remove it...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

> missing. There is a list somewhere of progs. which are FPU aware and
> benefit, can any one point me.

I don't think Photoline ever used the FPU. I think it used DSP but thats
all. The difference between the two versions is likely to be that the
ST version is 68000 code whereas the TT/falcon version is 68030 code.

The best place to ask about FPU compatibility is the authors of the
software in question...a lot of Falcon software still will not use
the FPU (even though FPU is faster than DSP for some things!). Most
Falcons will not have an FPU, which is why the software rarely uses
it...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

well, to my surprise, I've gotten IConnect (the TCP/IP stack that comes with CAB 2.5 and 2.7) to actually work with Internet Direct, my ISP. And judging by my tests of it, I think I want to use this with CAB all the time.

Now, I seem to remember a few weeks ago that someone said it was possible to have both STiNG and IConnect running and cooperating with each other. Or was I hallucinating this?

If not, could you please re-post the details on how it all goes together? Thanks!

Well what I believe they were talking about is that you can have , like I
do, Sting and iconnect enabled at the same time.. (sockets.prg and
sting.prg)

This makes it easy to switch between diff. client, with no need to reboot.
however, It would be very very nice if there was something like glueStik
for iconnect, or visa versa.

Should be no problem on this setup although a 9600 modem may be
a bit slow to surf the Internet with.

> I don't want to spend any money on software as my old lady would kill

>
> I have run Mint .95 for some time but I gather there are later
> versions than this.

Yes, I think MiNT is now up to 1.15.x

>What is the best freeware multitasking environment for the
> ST? Where do I get it? Will it allow me to run my scsi cdrom as did
> mint .95?

Well, I think really that MiNT is the only freeware multitasking
environment for the ST, although you will need a multitasking AES
as well if you want to multitask GEM applications.

> What about a browser/ppp setup? What is required?

Personally, at the moment I use STinG. It's quite easy to setup,
supports PPP and is quite popular amongst us Atarians and so there
are always plenty of people to help you out if you have problems
setting it up.

There are a few WEB browsers available for the Atari, but at
the moment I would say that the only useable browser is CAB.
CAB is now a commercial product although the older version (1.5)
is still shareware and available for download.

You can find the latest MiNT version from :
http://yescrew.atari.org

If you download KEMD2.ZIP you will find version 4.1 of Atari's
Multitasking AES.

STinG can be found on the authors Home Page :
http://www.stud.uni-hannover.de/~perot/index-e.html

CAB 1.5 can be downloaded from :
http://www.flinny.demon.co.uk/

Regards,

Ben Hills.

>Maybe someone else could enlighten us!

I believe that it holds the results of DNS queries: that's to say when you
type a URL the ISP converts that into the "real" address, and the DNS cache
on your drive gets updated at the same time. Presumably it's to speed up
resolving that site the next time you access it.

These items gotta go!!! I need the space!!! They goes
as follows: <6671>

Hardware: All with Manuals

* Atari 1040 w/16 Megs and a switcher (8 to 16 Mhz) $275
* 130+ Hard Drive (In 2 cases connected by a cable) $150
* 500 + Hard Drive w/CDRom & Tape backup Drives $450
(Comes with 20+ Tape Carts, 4 CD case caddies & 1 Atari CD with
lots of programs - <Gemini Atari CD-Rom, Dec. 1993>)
>>>>> Oh... and I'll leave the software I have on it too! <<<<<
* Color Monitor ..... $ 35
* Black & White Monitor ..... $ 25
* Alfa Data Track Ball ..... $ 40
* Viva 14.4 Fax Modem ..... $ 25
* Zoom 14.4 Fax Modem ..... $ 25
* Atari SM804 w/Outburst..... $225
(Needs new drum and toner)
* Migraph Hand Scanner ..... $ 30
* Migraph Hand page scanner ..... $ 50
Hardware: No Manuals

* External disk Drive (Needs Power Adapter, Radio Shack) . $ 5

Software: All With Manuals

* Easy Draw ..... $ 10
* Degas Elite ..... $ 10
* Typesetter St ..... $ 10
* Stalker/Telecommunication Software ..... $ 20
* G+Plus ..... $ 10
* Migraph OCR/Optical Character Recognition Software ..... $ 10
* Mr Boston Official Bartender's Guide ..... $ 2
* The Juggler ..... $ 5
* Geneva/(Multi Tasking Program) & NeoDesk(Desk Top Prg .. $ 50
* Hyrid Arts Semte Track w/sync box ..... $ 75

Software/No Manuals:

* Hybrid Arts Ludwig Music software ..... $ 2
(Disk Only)

Games: All with Manuals

* F-15 Strike Eagle Flight Simulator ..... $ 10
* Elite/A Fantastic Voyage ..... $ 10
* Defender Of The Crown/Knight Fight ..... $ 10

* Knightmare/Knight Fight ..... $ 10
* ShadowLands/Barbarian Fighting ..... $ 10
* Barbarian/Fighting ..... $ 10
* Lemmings/Maze and Building ..... $ 10
* Ultra V Warrior of Destiny/Knights ..... $ 10
* Baby Jo/Baby Super Hero ..... $ 10
* Drakkhen/Dragons ..... $ 10
* The Pawn/Good and Evil Fight ..... $ 10
* Dragon Of Flame ..... $ 10
* Breach ..... $ 10
* Time Bandit ..... $ 10
* Quest Glory ..... $ 10
* Romancing The Throne ..... $ 10

Games Disk only:

* Dragon Master ..... $ 2
* Rambo 3 ..... $ 2

Programing Software & Book Combination:

* Mark Williams C Compiler/4 Disk/ and Update (2 Disk)
Mark Williams C For The Atari ..... $ 15

* CSD C Source Debugger1 Disk
Mark Williams CSD C Source Debugger For The Atari ST ..... $ 10

Programing Books:

* Prospero C, Language, AES Bining, Library, VDI Binding . $ 10

A lot of my beta testers and also myself use this combination, even with beta versions of MagiC. It's unlikely that there is a general problem of this kind because this would show up very early in the beta test stage.

Of course, the most funny bit about the bombs is what the Atari manuals write about them.. it supposedly means TOS detects an error that could "damage the operating system" (it still says so in the Mega STe manual which, IIRC, never had a disk-based TOS) :) The advice (please ignore this) is, if a program bombs, immediately switch off the computer "to protect the operating system" (lol!) and if it happens again, never use the program again. :)

I wonder how much damage I'd do to my operating system if I'd switch off my falcon immediately if one of my 30 processes under MiNT produces a buserror. I think I'd rather just continue working, thank you very much. :)

Just to prevent misunderstandings, the bombs are nothing more than a result of 680x0 TRAPs that are not used for anything else, ie the 680x0 error TRAPs (bus error 2 bombs, address error 3 bombs, devision by zero 11 bombs, stuff like that). I don't think there is any error that can cause a trap 20 (if my memory serves me right that is) so 20 bombs should indeed be a combination of errors. Pity Atari didn't remember to add a space behind the last bomb. :)

Maurits.

Yeah I had the same problem when I got my 4 meg STe when they first came out in Australia.
The guys at the repair place had it for a week and said there was nothing wrong with it.
Got it home same thing. So I took it back and told them to replace it again.
This time they did. (Still didnt believe me though) :-)

Hello friends:

I have a quantum 540 scsi I have used for 3 years and a Falcon 030
14. This combination as I said has been workin no problem. The scsi
Quantum is inside a metal box with its power supply.

Ok so the problem is that the other day i disconnected my CD ROM
from the chain and I can not boot my scsi Hard disk quantum . I
tired with the CD ROM alone with termination on and off and nothing.
I tried also changing the Quantums scsi number and nothing.

Now, I jknow the drives are fine because I tested them again on
another computer. I tested the continuity of the scsi cable and looks
fine.

When I boot AHI it reports "UNIT 0 not Responding"
If I use HDDRIVER it says " S/H Atari Megafile" for SCSI:0
So I am wondering if my SCSI Interface went bad!

When the driver loads it makes the Cd ROM or SCSI Quantum spin and
LED Lights but I get no ID from the drive.
Sometimes the driver stops until I turn the drive OFF and then other
AUTO PRG will load.

My Falcon's SCSI is set to 7
The CD ROM 1
The Quantum set to 0

Any ideas? Is there a system prg to check the complete system and
scsi interface?

Thanks a lot.

Raymond

Hi everyone!

I have bought a Yamaha TX81Z some time ago, and got this TX81Z edit-program with it. The problem is, the disk with the program is broken. TX81Z_ED.PRG won't load anymore! So now I'm looking for this file! Please e-mail it to me if you have it.

Greetz,
Kasper

P.S. I was in search for a monitor some time ago, and I found even more than one now. I hope to have two working Atari's pretty soon. That would really be nice for my MIDI setup :-)

>
> You will need to get inside and push home all socketed chips. Clear
> out the dust and garbage while you are there :-)

It might not only be that the chips have come loose - many times the problems are due to oxides on the component pins or in the sockets. The most common chips to cause this kind of problems are the GLUE and MMU - the two squared chips. The problem is that you might damage the sockets if you're not careful - it's best to have a special PLCC lifter when you remove them...
To clean the legs and the sockets, get a fibre-glass pen to remove oxide.

That would probably be a question for the VST mailing list, eh?
Well, I'll answer anyway. You can use Cubase VST for PC for editing etc,
but there are a couple of other nice packages which might be better
suitable if he's not in need of the sequencing function, like for
instance WaveLab and SoundForge. Check them out.
Otherwise, there's no problem doing it on a Falcon either ;)

Hi,
If it works fine on your other system, perhaps a loose connection
occurred somewhere with your cables. That would explain the sudden
disappearance and why it worked on the other system.

Hi

I have an Amiga CD32 with the following games:

Brutal Football Alien Breed Special Edition/Qwak
Project-X/F17 Challenge Zool
Microcosm Diggers/Oscar

The only thing I don't have is the RF lead (standard lead from console
to tv), as all the consoles share the same lead.

I am after a Jaguar CD system and some games.

Please note I am the UK and shipping could be more than it's worth!

Incorrect in a minor way....TYou can get a 3.5 into the standard case without modifying the shield, but you have to mod the HD bracket and use an interface....ASP sells these, I use a 4.3Gb 3.5" drive in a STANDARD cased and shielded Falcon without any problems so far....used for D2D with AudioTracker..

3458. STBook 4 sale!

Newsgroup: comp.sys.atari.st
Date: 1999-05-25 00:00:00 UTC
From: sandrija@pravo.hr
Message-ID: <7if38h$r91$2@as102.tel.hr>
Source record: 78181

ATARI STBook (1992) is now for sale.

Specs: 4 Mb RAM card (Toshiba) is installed,
HDD is IDE 2.5" 230 Mb,
external 1.44 floppy with ACSI port on its case,
power supply and charger + 3 home made batteries,
black serial mouse + driver,
custom software.

Computer can not be used currently (display connector needs
resoldering, or else...don't have time or need to check, worked
fine last time I switched it on, though). The upper side of
the case has small cracks on it.
WILL sell for spare parts! (but as whole package)

Make your best offer at my E-mail address: sandrija@pravo.hr.

Hi guys,
I have an almost new Astra 1220s Umax scanner.
This is a unit used to develop UMAX functionality of
ScanXPRO. It is in pretty much in new shape.
It comes complete with the full hardware/software for
the original platforms.

I need to sell it to make room for the new 2400 series
to make ScanX function with it.

I am selling it for $165, including a copy of ScanX PRO
(saving at least 85 US$).

Prices in US$.

If you are interested, please drop me an email.
Shipping & taxes, if any, are extra.

Please send email to: homa@canada.com

Best regards,
Nima Montaser

Hello friends:

I have this problem with my Falcon SCSI connection.
I have a Quantum 540 SCSI drive and this drive is good and I have been using it
for a while now without problems. The drive was working fine until I tried
to connect a new CDR. I have been using my Falcon with the SCSI Quantum and
a CD ROM NEC. Well after I experimented with my new setup for a while my SCSI
drives would not boot at all. Now none of the drives boot. I tried many things and
nothing. I connected only my CD ROM and does not boot, I connected my Quantum
, nothing. Is it possible that I may have damaged my SCSI Interface when I
disconnected the cable? Is there a prg to test the Falcon system for SCSI interface
problem? It is not a termination problem because my Quantum is inside a metal
case and I did not change its termination which is on as it is the last drive , I connected
thisone only
as a test. When I scan for IDS it reports "Unit 0 not responding" or
CH/Atari Megafile"

Any ideas? Thanks for you help

Raymond

Just a thought since your using AHDI. Have you ever set the boot ID's with
Uwe's AHDI applicaton? If AHDI is expecting to see ID 0, and the
device is not connected, it will not get past that ID.

Mike

LBA addressing is required to support IDE drives > 8 GBytes. The
HDDRIVER manual doesn't say anything about it because there is nothing
for the user to configure, it simply works.

> Please explain to an ignorant, is it someting I can do anything about or is
> HDRIVER handling it all by itself?

HDDRIVER handles it all by itself, so a drive requiring the special LBA
addressing mode can simply be connected without the user having to care
for any configuration option.

Actually it's more like a quick fix. The last try should be opening up
the machine and reseating all the chips by hand.

Never do either of these with the machine switched on of course!

There is no standard structure, since the OS is in ROM, not on disk. The
only obligations for the system are to have ACC files in the root
directory and an AUTO folder for programs that will be run on bootup.
You're free to put anything else wherever you want.

> and how
> do you setup for font that kind of stuff. Screen savers.

For screen fonts you would need NVDI (commercial). Screen savers would
be either ACCs or AUTO progs, depending on what the docs say.

Bios ??? This isn't pc world ?

That makes it sound like a HPUX friend of mine who told me he didn't
have time to upgrade RAM on one of his servers, because you have to
actually recompile the kernel to get it to work!

The ST is REAL plug'n'play. TOS will recognize as much ram as it has, at
least within the 4Mb limit.

Hi,

A couple of years ago I brought my old Atari ST 1040F to my wife's school as a game computer for the children in het class. It has become the most popular computer at her school.

Yesterday she brought it back, several problems. :-(

To fix one of these problems I am looking for a wiring diagram to connect the video out of the Atari ST to a monitor with SCART connector, this because severel of the wires in the cable are loose and I don't know which wire goes where.

Please help me, my wife, and the 16 children in her class.

Thanks for reading this,

Kees Maas

I have a better idea. Download YSEDT2_6.ZIP from my homepage :

http://www.telebyte.nl/~mt/yseditor.htm

This is a very fine editor for the TX81Z. You can load voicebanks from
other dump and editsoftware for the TX81Z in this program without
problems most of the time. So you can easily switch to this program if
you used another program before. Try it!

See you on my homepage!

>
>Wouldn't it be nice if the thro' port reappeared!

I don't think it will, because a normal through-port would not work for
most cards anyway, because of the CT2B CPU fan. This makes it a much
better idea to either have the kind of add-on through-port that Centek
already made (and *should* market), or to *demand* that makers of graphic
cards include a through-port in them, so the CT2B can be plugged into it.

But the best bet is Centek's add-on through-port, as that will definitely
allow any card to be plugged in.

Yes, that should work, and would allow a consistent implementation even for
cases where no card RAM at all is available.

>>>It's simple enough to cache icon bitmaps in local RAM on the graphics

So if I use a normal Blit call to draw an image on screen, then the driver
will modify my original copy of that data...?!? No thanks !
I certainly hope I misunderstood what you meant above.

>This could of course, theoretically, still cause problems if an
>application modified part of the bitmap, but I don't think that's
>very likely. If it happens, you can turn off the caching.

It can also cause problems if the unmodified bitmap is needed for any
other purpose, as part of the original data was modified by the driver.

As I see it that sort of thing can only be done by newly defined functions
specific to that particular driver, not in any generic GEM drivers, as the
modification of source data is a new behaviour that never existed in any
traditional GEM drivers.

>>the same RAM area. Also, not all icons use 32x32 format. Very few of
>>the ones I use in Thing do.
>
>I've not seen file icons (which is the only ones I think it's worth
>worrying about (since other icons are not likely to be drawn very often))
>of other sizes, but I'm aware that some desktops can handle them.

Modern desktops (eg: Thing, Jinnee, etc) are capable of handling icons
with freely mixed sizes. Even the normal 'NewDesk' of Atari can display
icons of any size, though it assumes that all active icons use the same
size as object #1 in the icon 'form' does.

>Could you perhaps point me to some archive that contains a few I could
>test?

There are lots of archives around for Thing icons, but I have not memorized
any URLs for such things, as I prefer to make my own icons.

On my homepage you can find an extreme case of 'micro' icons intended for
use with the normal Atari 'NewDesk'. These icons are only 1 pixel high,
and even that part is blank... The purpose is to allow placing a lot of
program labels on the desktop even when running normal ST resolutions.
I used those icon sets a lot before I had any Falcon or TT.

>What sizes are your icons, by the way?

Most of my icons are 32 pixels wide, though some are only 16. I also have a
few very large ones (The largest is 96 pixels wide). The height varies very
much, though most are between 16 and 32 pixels high, and I seldom exceed 32
pixels height.

----- snip ----- re: caching large bitmaps in card memory
>
>The Eclipse/RageII is apparently going to be sold with a 4Mbyte card,
>so as long as you stick to 16 bit colour there should normally be plenty
>of free space.

Hmmm. My normal rez now is 960x720x8bits == 675 KB, and a 16 bit version
of that rez would of course cost twice as much, or 1350 KB. This means
that there will be room for two 'extra' bitmaps of that size then.

>In any case, caching won't ever hurt performance so that you'd notice.
>It can only help.

Sure, provided that it is implemented efficiently.

----- snip ----- re: 'background buffer' of AES
>
>IIRC, the buffer will normally be put in alternate RAM if you have any.
>If not, it could of course be very helpful to redirect it.

Actually I doubt that. I think it is initialized to point to TT-RAM if
any is present, but other Alt-RAM is not recognized at bootup, so then
ST-RAM will be used instead. Some extra program will be needed to make
this buffer use Alt-RAM added to the system by Maddalt.

----- snip ----- re: APPs allocating VRAM
>
>It's definitely better to put the available memory to use than to just
>leave it empty.

I agree.

>Also, since allocation of such memory would have to be done via a VDI
>call, I don't see why there should be any need for rules of any kind.

I disagree. This VRAM is a limited resource. As such it is not good for all APPs that want some of it to assume that they can use it without proper regard to the real limitations. They also need to release such RAM whenever they don't really need it, to give other APPs a chance to improve their performance by using it. This can't be enforced at driver level, since the needs vary for different APPs, so it will have to be enforced through a set of programming rules.

This is a little similar to how kernel RAM can be used by modules of STinG. It is needed for best performance, but if a single module hogs all of it, then the system congests.

----- snip ----- re: blitting monoplane data to multiplane screen
>>
>>Yes, provided that the driver software does it that way, blitting only
>>a straight copy of the single-plane data into VRAM and then using the
>>internal card operations to blit this into the active screen RAM. But
>
>I don't know how other graphics hardware does it, but in the case of
>the mach64 kernel, you don't even have to blit into a temporary buffer.
>The mach64 will do the expansion on the fly.

That is bound to be less efficient, since it means repetitive CPU code for writing the data to each plane. The method I spoke of means that the CPU only makes one simple block move of the monoplane data and then tells the graphics processor to expand it. That must be better !?!

>>I strongly suspect that some current drivers don't do it that way.
>
>If they don't they will be very slow indeed, but I have never seen
>anything besides the NOVA VDI in action.

And I don't have any graphics card at all, so I can only speculate...

----- snip ----- re: caching fonts in VRAM
>
>Since we're talking about a cache here, that isn't a problem. You

>some fonts can be removed when others need the space.

That was part of what I meant, that there must be sensible limits.

>You have exactly the same problem with normal RAM for that matter.

Yes, to some extent, although that will normally be a much larger area.

>>>As I've described above, there are various ways to keep the amount of
>>>such data down.
>>
>>Agreed. But do all drivers use those ways ?
>
>I'd be surprised if not everyone made use of mono-expansion, but I

>think fVDI is currently alone in supporting the other ways.

Well, I'm not so familiar with fVDI internals, or NVDI internals either,
but I assume that both support loadable drivers that allow omptimization
of such things to be added by third-party programmers. If so, it should
only be a matter of getting the necessary programming docs out to those
programmers that are familiar with the graphics cards needing support.

>>I can't stand the Intel CPU models. I have worked with them, many years

>>Those who designed those models must love complication for its own sake.
>
>You have to remembe that the x86 CPU architecture has its roots in the
>4004...

I know: 4004---8008-+-8080---8085-+-8086---etc
| |
+-4040 +-8088

But that is still no good excuse for the IMHO *silly* way some things were
added for the 16 bit versions. (eg: 8086 segment registers)

After all, the 680x0 series is also descended from early 8 bit CPUs.

Again, that sounds fine, but I can't help thinking that some fairly large
ispLSI circuits (or equivalent) will be needed to adapt that CPU to the
existing Falcon hardware. Those will cost money, and so will development
of their contents.

>>The important thing to us Atari fans is how fast it will be when emulating

>higher speed, I think it's reasonable to assume that it will be pretty
>fast even under emulation...

Yes, I agree, but no emulator of this kind has been made yet, so it is very
hard to estimate the effective speedup factor.

>You could always ask someone with a recent Mac what kind of speed they
>get under 68k emulation.

That would not in itself give a fair estimate of speed in a Falcon, since such a Mac will be optimized for use by that CPU, which the Falcon isn't. It'll be interesting to see some NemBench files for the Tempest when it is finished, so we can compare it to other accelerators in a meaningful way.

A good M.O, but I think you may have missed the CPXs. (or STING.PRT)
They too differ between these versions.

> I managed to get 1.20 working OK but have noticed a problem with
>the Dialer in that even when I have disconnected the modem via the Sting
>Dialer dialog, when I next boot up and call up the Dialer it recognizes

>disconnect the modem and exit the Dialer and then recall it in the same
>session it will recognize the modem as being offline but if I reboot and
>then call up the dialer it will again indicate that the modem is online.

This is typical for setups that have the modem's port, or the Masquerade
pseudo-port, activated in the saved settings of the STNGPORT CPX. These
settings are stored in the file STING.PRT, and that is normally in the
root directory of your boot partition.

The proper configuration is to leave both the modem's port and the
Masquerade port (if used at all) inactive in STNGPORT.CPX, and only
let them be activated by the dialer.

>Any thoughts on what I have set incorrectly. Unfortunatley my saving of
>the Sting 1.15 set was faulty as although it is still working OK I'm
>getting the same problem as above and it definately wasn't like that
>before i installed Sting 1.20

That is why I think you missed backing up the old CPXs and/or STING.PRT.

I recommend that you try STinG 1.20 again, this time with special attention
to the STNGPORT.CPX settings. Hopefully this will fix your problem.

Hi everyone,

I've recently had some hardware problems, causing me to go 'off-net' for a little more than a week. I'll try to catch up with the newsposts from this period and respond where appropriate later. This will take me some time though, so please try to be patient.

Sounds like a hardware problem. It could be anything, from the keyboard
to an unseated chip. Try taking the machine apart and reseating all the
chips and connectors.

The PPC chipset is 100% designed and built by Motorola and
is a RiSC processor family using a very cut down version of
68060 chip routines. IBM and Apple were and are both
interested in this technology as - for a side point - the G3
(ppc 750) at 400MHz runs all but floating point arithmetic
at aprox 200% of the p2 450 - ie. it's twice as fast. As the
p3 is 50% faster than the p2 ... the G3 is about 50% faster
than the P3.

IBM have and continue to develop server systems and embedded
control systems using the PPC chips while Apple have had PPc
in all their computers for over 5 years now.

Well, suggested release is third quarter and, afaik, the
emmulation is working well, the boards are almost bug free
and are now being evaluated for USB support. I very much
doubt if Core Designs would say a 200ukp retail price and
then change it by much - they are more likely to reduce the
specs of the board as they steadfastly believe that an
accelerator should not cost more than a new computer !

> > >But with a chip like this you need very little more, so the hardware

> of their contents.

I'm not quite sure what u're getting at here but as two side
points, the Falcon was designed from the start to allow easy
implementation of external processor upgrades at, it was
rumoured, Atari planned to release upgrade boards for them
themselves. Second, the PPc chip being used is a 603 which
has been around for a while and the chips and support
hardware are now 'out of date' by Apple standards and it is
all quite cheap.

> >Given that it starts out with a factor of a hundred or so (if running

> >fast even under emulation...
>
> Yes, I agree, but no emulator of this kind has been made yet, so it is very
> hard to estimate the effective speedup factor.

Well, based on the Apple and Amiga emmulation figures, Core
design hoped for an emmulation speed of around the same as a
80Mhz 68030. This, along with the much faster memory access
of the SDRam should provide a serious boost to the Falcon.

Also to be remembered is that the Tempest emmulation is
being enhanced in two directions. First, it is hoped that
the emmulation system can automatically switch on and off
per application allowing natice PPc code to run on the
Falcon - much as the Apple systems did and still do. This
could lead to a number of much faster programs designed for
the PPc chip that don't use emmulation. Second, the Tempest
board should run happily alongside any other 030 and 040
chips in the system maening anyone with an Afterburner can
still use it and normal falcon users can still use the 030
allongside the PPc chip ... dual processing basically.

>
> >You could always ask someone with a recent Mac what kind of speed they
> >get under 68k emulation.
>
> That would not in itself give a fair estimate of speed in a Falcon, since
> such a Mac will be optimized for use by that CPU, which the Falcon isn't.
> It'll be interesting to see some NemBench files for the Tempest when it is
> finished, so we can compare it to other accelerators in a meaningful way.

Under emmulation expect something about the same as a 45Mhz
040 (rmembering that no other 040 board has SDRam support)
while under native PPc mode (no emmulation) this will be

dramatically improved. Core design are currently talking to a number of developers about PPc native versions of programs.

Please note here that I am NOT a member of Core Design, I simply know them quite well and read their press releases.

Ohm it also looks like the Eclipse and Tempest boards will also work on a TT with a new board being developed to make the TT expansion port Falcon compatable and expected price for that will be around 25-30 Ukp. Check the WWW site :)

I have managed to get my hands on some more memory, as usual they will
come with fitting instructions for the STE, I'll be adding SIPP and Mega
STE instructions soon, a disk of software on a memory theme and postage
and packing for the UK; post will be extra for overseas Atarian's.

STE and Mega STE
520/1040 to 2 meg ..... ï¿½10
2 meg to 4 meg ..... ï¿½10
520/1040 to 4 meg ..... ï¿½17.50

SIPP's

520/1040 to 2 meg ..... ï¿½15
2 meg to 4 meg ..... ï¿½15
520/1040 to 4 meg ..... ï¿½25

With every 4 meg purchased you will receive an edition of ST+ Fanzine.

Now there's no excuse not to upgrade your STE/MSTE;)

As always payment can be in GBP or USD (USD cash only)

> I'm surprised you would keep the speaker!! :)

Yes, keeping the machine orignal as i can :->

> Also, how close is the speaker magnet to the drive casing?
> The speaker isn't a 12" subwoofer but it is still a magnet...

Yes, i know the problems with data media and magnets.. :)
But the drive is "shildet" by his own case, the speaker, not the same as original, a flat one, hooks below the bracked. Itï¿½s enough space between mainboard and bracked bottom. Works fine :) No hard drive errors.

But watch out, speaker should not loose his hook..
It falls directly to the mainboard, isnï¿½t good if the machine is on!

Regards, Robert

> Falcon030, 14mb ram, 540mb hd, 17" svga monitor, MagiC, Pagestream, NVDI,
> ExtedDos Pro, ICD HD utilities.

No way, bracked is too smal..
Isnï¿½t funny to have a working hard drive in the falcon..

One screw can bee used, but you have to drill the plastic case backside.
But itï¿½s only one screw.. :/

3.5" hard drive sit directly on the flatwire, isnï¿½t nice mechanical..

Have a look to my download site, you found a smal archice with CT2
picture, shows what i made with the 2.5" bracked and the 2.5" drive..

(But itï¿½s nothing for 3.5" devices. Not enough space.)

One device must have TermPwr Jumper ON.
No TermPower, no termination..
SCSI Bus have an open end, doasnï¿½t work well.

> When I boot AHI it reports "UNIT 0 not Responding"
> If I use HDDRIVER it says " S/H Atari Megafile" for SCSI:0

Mario Becroft doies one that will work in STF/FM, gives you TOS 2.06 (I still have some of the boards where you can choose NOT to have TOS2.06 though)...ASP sell in UK (that's me), there are other delaers around the world....

Source record: 78072

Hello,

On the subject of someone writing the software for a telnetable
BBS.. how about expanding an existing one. I know the source to TLink
(?) is available. It is written in GFA basic.

On a permanent IP address, try www.ez-ip.com . Its a free service that
will give you a static name to your dynamic IP address. I have the name
atari.dyn.ez-ip.net. You will need to "log on" manually by going to the
ez-ip web site. They have clients that will do it automatically, but
not an Atari one... yet (anyone?).

I've been using it to test the web server Weblight and the Atari IRC
server IRCD, both by Olivier Booklage(sp?).
So one night for the heck of it.. try http://atari.dyn.ez-ip.net to see
if the server is up..

3495. REAL Keyboard fix

Newsgroup: comp.sys.atari.st
Date: 1999-05-26 00:00:00 UTC
From: Technoid Mutant <Technoid@cheta.net>
Message-ID: <374C731A.E5907C97@cheta.net>
Source record: 78073

In early 1985 I bought a 130xe computer from Computer Image (north) in Miami Fl. In just a few days, my Start key stopped working and I took it back. They 'reseated' the key but now I know the real problem.

Some years later the keyboards started to fail key by key. Sometimes just one but usually a set of them. I opened my xe keyboard and exposed the thin, mylar sheet on which the keyboard circuit is printed and ran my multitester on it. You don't need a full ohmmeter, a continuity checker is good. An ohmmeter tells you a little more (like which trace is next to die)....

Now that I knew that a trace or two or three had for whatever reason lost it's ability to conduct well, I walked the probes from each end towards the middle of the trace in question and found the PORTION of the trace that was failing to conduct.

I then bought for 10 bucks a two ounce bottle of a nifty products called "Nickel Print". This is a clear paint with tons of little particles of nickel suspended in it making the paint grey when fully mixed. You simply 'paint' over the section of trace that has gone bad and it works again. That easy, a permanant fix for that section of trace. Other sections will fail later and after a few years your keyboard mylar will be as much paint as the original print used. Oh well. I have entertained silk-screening new mylar overlays myself because there are parts of traces hard to paint without shorting another trace.

The paint comes with a brush in the top, but this is really way too big for any useful purpose and especially for painting keyboard traces. Here are the tools I eventually used for years and still use to fix these traces. This method works with any keyboard on earth but esp for printed mylar:

Exacto knife or even a steak knife. This is for scraping away mistakes like bridging two traces etc. If you do bridge a trace, get the mistake fixed quickly and you won't have to scrape. The edge of the matchbook is good or use a dry match (see below). If you do paint over the wrong trace, clear just the bit between the bridged traces. Use a pointy thing and run it between the traces rather than WIPING the paint away and repainting. The reason is that the Nickel Print paint and the original paint used to print the trace pattern are very alike and after you wipe you will notice that the solvent carrier has conveniently erased several other trace segments making a bunch more work for YOU.

A pack of paper matches you can get at the gas station. Use the scissors to cut the ragged edge of the match at an ANGLE. This is your brush and you have 20 of them per pack.... The angle makes a nice point

at the bottom of the match with which to 'draw' your trace segment-
kinda like a felt-tipped marker. Use VERY little paint. If you are
neat it will work and only a thin coat is required to complete the
circuit so don't glop. The end of the match will dry quickly and you
will cut a new one fairly frequently during a several trace-segment fix.

A pair of scissors. (if they are pointy you can use them to scrape
instead of the point of a steak knife)

A beer. (this is for a steady hand)

The paint lasts forever. Just thin it with a little TOLUENE - you can
get a way-too-big-for-the-job container of it cheap at the hardware
store - when the paint starts getting thick. You want it pretty thin so
try to remember the viscosity of it when you first get your bottle.

I bought my second 2oz bottle from CENTRAL UTAH ELECTRONICS at
801-373-7522 just recently. This bottle cost $7.35 and my company had
to buy three to meet the minimum order. They carry ALL Kinds of parts
so you can probably just get a couple of other neato things to round
things out. The paint is classified a hazardous material and can only
be shipped UPS ground so don't be in too big a hurry. You might try
some local supply stores first if you live in a larger town. (I don't
anymore)

You can also use the paint for lots of other repair jobs, but this is
the one that made me find out about it.

Some places sell little 'pens' that draw traces. It looks like a great
idea, but don't bother, they suck.

All right, I accept that it's very unlikely, but I've run out of things to look for. My problem is that there is no problem, no symptom, apart from this difficulty with booting. In all other respects the computer behaves flawlessly.

But unless somebody has a bright idea, I am stuck with using HD Driver v 7.00.

My computer looks like this.

TT, SCSI 7 (with Matrix TC1208 video card)
Internal drive Quantum Fireball 3.2 gb SCSI 0 (partitions C-J)
Syquest ezFlyer 230 mb SCSI 5 (partition L)
Seagate ST-157N 46mb SCSI 2 (partition K)
Sony CDU415 cd-rom SCSI 1 (partition P)
SupraDrive FD-10 SCSI 4 (partition M) on ASCI/DMA bus

HD Driver is on the Seagate, with partition C set as default boot source.

Magic 6.01 + NVDI 5 + Matrix software on partition C
NVDI 5 + Matrix software on partition D

I boot to Magic (by default) from partition C
I boot to TOS or Mint with NVDI from Partition D
I boot to TOS or Mint without NVDI and without video card from partition E

Partition I is a Minix partition for Mint

There are obviously endless permutations for installing software even given that HD Driver can't be on the Quantum. e.g I haven't tried instaliing Magic on the Seagate.

Not to many expansion card do have pass throught connectors. The A/B and Mighty Sonic do. The Screen Eye, Expose and Falcon Speed do not. After looking at the CT2B, (:0), I would be more inclined to solder two rows of connectors on a Screen Eye, Expose, Falcon Speed or NOVA before I messed with the CT2. It more than likely runs pretty hot, and having it as the bottom card can't help much. The other cards run pretty cool. It would be a tight fit with the NOVA underneath however. I purchased the CT2 for use with Expose (50Mhz to 128MB of fast ram as opposed to 40Mhz to 64MB with the A/B). Now I can easily fit a 3 minute 8mm film into memory with room to spare at full screen grab.

Anyone want a Mighty Sonic with 32mb of fast ram?

Mike

I sent David Leaver's message about his problems with the above to Andreas Kromke, as he doesn't read this group; I am in touch with him because I am translating his MagiC programmer's docs. His suggestion:

1. Disable DMA background transfer
2. Disable the enabling of the CPU cache in HDDRUTIL

He also says that he assumes this is a hardware problem. With *his* TT HDDRIVER always crashed when the driver activated the CPU cache. He also had another TT once on which MagiC wouldn't run at all. The whole SCSI portion was broken - he then obtained another TT (?in exchange?).

Maybe Uwe has other ideas?

3506. Atari Porfolio .. yeh.. yeh.. I bought one...

Newsgroup: comp.sys.atari.st
Date: 1999-05-26 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <374C8073.3EC@geocities.com>
Source record: 78084

Recently saved an Atari Portfolio that was in a nearby used computer store. It had been there for.. a long time. (I remember it being there in 1994 before I went to Guam...)

They had been wanting $99 for it.. finally was able to talk them down to $40. Figured the price was right. Being a Newton user.. this makes a nice curiousity piece.

So... here's where I ask perhaps the impossible, but I would like to get this device functioning at least for display purposes (maybe as a cute sign in device for our club meetings.)(Atari club)

I need help in the following areas with the Portfolio. Any help will be appreciated....

1. Information... and where to find information on a Portfolio.
2. Hardware help... how do you take one of these babies apart. The device seems to have a loose wire to the screen. Also the keyboard has a couple of keys that are not responsive.
3. hatches... where can I get a spare battery hatch for this thing?
4. Software... what was/is the portfolio capible of doing? I know is it based off a IBM XT... how much of that software is compatible?
5. Memory cards... who sells them?
6. Anything else you want to to tell me about the Portfolio.

Figure I'll check out radio Shack for a compatible power supply, and was there ever a battery pack for this device, or did it just use standard batteries.

Like the Lynx, Jaguar, and ST, the Portfolio was an avenue that I figured I'd explore of Atari in the future... but since the opportunity and price were right...

Well.. suffice to say.. I'm the community's newest Portfolio user. (grin)

Doctor Clu

>>
>Where do I find this setting?

In DEFAULT.CFG (usually quite early in it).

It is a measure of the time within which an ISP should be able to respond.
When twice that time is exceeded without any incoming acknowledgement of
data, then STinG assumes that some packets were lost and retransmits them.
If the setting is too short, then retransmissions are made too frequently,
and when there is no need for them. This congests the connection, causing
an extreme slowdown of outgoing traffic.

Setting the value too high is not good either, as that would cause very
long recovery delays whenever a packet is damaged.

I recommend a value in the range 200-600 ms. I use 500 myself.

>
>That happens to me with 1.15! on my TT/030!

I only know of one thing which can (and definitely will) cause that effect.
This is when you have installed STing with a mixture of components from
the STinG 1.20 release and some from some earlier release (or vice versa).

Certain structures have been altered in STinG 1.20, such that some of the
components are 'allergic' to some components of older versions (or v.v).

The 'sensitive' components are:

STING.PRG The kernel itself (handles port drivers)
STING.CPX The main CPX (inspects port drivers)
STNGPORT.CPX The port CPX (manipulates port drivers)
DIALER.APP The dialer (manipulates port drivers)
ETHER.STX Ethernet driver (port driver)
MASQUE.STX Masquerade driver (port driver)
SERIAL.STX Serial driver (multiple port driver)

If any of the components above delivered with STinG 1.20 is used with any
other of those components but from an earlier release, then the result is
very likely to be a bomb raid.

Additionally, the old STinG release contained some 'dummy' port drivers,
intended only as 'placeholders for the future. These are not included
in the new release and the old ones are not compatible with the other
new components (as it is a port driver structure that was changed).
Therefore the 'dummy' drivers must be removed or erased when installing
STinG 1.20.

They were:

CENTR.STX These three are all 'dummy' port drivers
LCLTLK.STX intended to be implemented in the future
MIDI.STX (NB: This is *not* the normal Midi port)

Finally some of you may have an old version of my CEN_PLIP.STX, and then
that too must be removed/erased, as it too uses old port structures. The

Cen_PLIP module is still not sufficiently debugged for a proper release,
so it will be some time before I can release it for real.

When all is installed as above, then the operation you described will *not*
cause any bombs, on any healthy TOS system. That much is certain.

Btw: I believe that all of this info is included in my UPDATE.TXT
files supplied in the STinG 1.20 archive.

Even that won't help, as vector 20 is undefined by both Atari and Motorola.
The only way to get that exception is by a program that changes the base
vector register of some hardware chip and then triggers that interrupt,
which is not the normal way of using any of the standard chips.

Under the circumstances I rather suspect some emulation error.

I know, and on a platform where no caching exists that kind of coding can do
pretty fantastic things, such as letting a 2 MHz 6502 CPU emulate other 8bit
processors at speeds reasonably near realtime.

>I remember using something like this in a wobbling
>scrolltext ages ago (around 1990), it definitely didn't work on my Falcon ;-)

Why not ? Just turn off the cache before running it. On a Falcon that must
be considered standard procedure for most older games, demos and intros etc.

Actually age is no real excuse for incompatibility. One of the oldest games
around is Dungeon Master, and it works fine both on TT and Falcon, except for
needing the help of another program to switch the TT to ST-Low. And IIRC that
game was written before Atari had even made any 68030 machines.

>>>But the only TOS that automatically detects TT-RAM is TOS 3.0x, so it
>>>really doesn't matter on Falcon-accelerators.
>
>> No, that is wrong. Falcon TOS also detects TT-RAM, but if an unpatched
>
>Really? I did not know that. Why on earth should it do something like that?

Because it is to a large extent based on TOS 3.06 of course. Plus some
stuff from MultiTOS AES that is. Also, while Atari chiefs decided to let
Falcon rot (though it didn't) in favor of game consoles, that does not
mean that the guys who designed it shared that view. They probably saw
(like I did) a FalconTT hybrid as the next logical step in development.
With 32 bits width both in address and data busses and with PC compatible
expansion bus instead of VME etc, and then TT-compatible RAM recognition
was an obvious necessity, for true upwards compatibility.
(Ah well, I can dream can't I ;-)

>> Falcon TOS does find TT-RAM it will bomb, because the TOS will attempt
>> to use blitter in that RAM area as well, not realizing that the hardware

>
>The Falcon VDI doesn't have any software-blitting at all, that's why it fails.

I know. It is the opposite of a TT that way, since that was the only model since the coming of STe/STFM/MegaST that was unable to use a hardware blitter.

>This is the same situation as on the AB, when TOS is notified about the
>FastRAM you *must* use NVDI, otherwise any blits to/from FastRAM fails.

That is not the full story. That would be no problem if TOS itself knew that it should place data needing blitting in ST-RAM first. Then that problem would not exist. But if TT-RAM exists it will attempt to use it for all graphics purposes too (except screen), even though it can't work. But like I said, the software is really modeled on the TT TOS, and that can 'soft-blit' from any RAM whatever. If only they had not cut out the 'soft-blit' support in the conversion ! All that it lacked was the truecolour support...

>I guess the built-in VDI can be patched, but doing so is probably just a
>waste of time since "everybody" use either NVDI or a graphics-card anyway.

True, but a real software blitter activated and *enforced*, so that the commands that activate hardware blitter refuse to (just as on TT), that could be very valuable for compatibility reasons.

>> That is one reason why the CT2 TOS 7.x boot mode with FastRAM is so complex,

Please do. I am always interested in such things, even though it probably is not applicable on my own system.

----- snip ----- re: split memory model
>
>By "split memory model" I mean max. 14Mb "ST-RAM" and the rest as TT-RAM.

Ok, but as I see it that is what all TOS compatibles do have. It depends on how you look at it. When you hear "ST-RAM" you evidently think of the CPU access limitation (via VIDEL), but that is *not* its original meaning.

The original meaning is one of extended capability, though naturally with some (much lesser) speed limitation since more other chips than the CPU can be bus masters in this memory. (ACSI DMA, sound DMA, video access.) TT-RAM lacked that capability, though it did allow for SCC DMA and SCSI DMA. (Another thing lost in the Falcon I'm afraid.)

>> with the matter. If they want to make a computer with a continuous RAM
>> area, not split in any way (as by having IO ports at $00Fxxxxx) that is up

>
>It is "splitted" in this sense (otherwise nothing would work, obviously), but
>on the Hades everything is "ST-RAM", there is no TT-RAM or alternate RAM. The

>advantage of this is that all memory is DMA-capable.

That is in no way contrary to my view of upwards compatibility, since it is an extension (not a limitation) of the capabilities of both areas compared to a TT, and thus another step in its original direction. What I opposed was only ways of implementing this that prevent software compatibility, such as having physical address maps that differ from the logical ones which are needed to access base resources (such as RAM) in an upwards compatible manner.

From: dlanor@oden.se
Message-ID: <374cbf28ea1950f@oden.se>
Source record: 77999

Hello Dan,

This post reminded me of a discussion held in the stik-beta-testers mailing list quite a while ago, where we took a close look at this sort of problem. As I recall it was due to serious problems that Newsie had under Geneva then.

We found the definite explanation for this conflict, and I decided then and there to write you a mail about it ASAP... Unfortunately the P in ASAP was delayed for some reason, and then I forgot about it... (Sorry!)

on Wed 19-05-1999 13:08 Dan Wilga wrote:

```
----- snip ----- re: problems with Geneva clipboard operations of GEM APPs
>
>Actually, the reason for the error message when using the clipbaord is a

>the same libraries) broadcast in order to indicate that the contents of
>the drive containing the clipboard directory have changed.
>
>You will get an alert if you are running NeoDesk 4 because it confuses
>this message with another one it expects to receive when an application it
>has run terminates.
```

Precisely. And the reason for this confusion is actually a documentation error combined with a design inconsistency committed by Atari during the latter stages of their development of MultiTOS. In most older versions up to and including (at least) release 0.83, Atari defined CH_EXIT like this.

```
----- Excerpt from GEM.DOC of MTOS 0.83 -----

CH_EXIT - 80 Version 4.0 and up

word[0] = CH_EXIT
word[3] = Child process's AES id
word[4] = Child's exit code

This message is sent back to the process when its child process
is terminated.

----- End of excerpt -----
```

Now, since you naturally wanted compatibility with MTOS and any followup systems from Atari, this is exactly what you have implemented in Geneva. So far so good, but a bit later Atari changed their minds, and forgot to mention this properly in their docs. As far as I can tell this change was 'snuck' in somewhere in the late releases of AES 4.0, after release 0.83 quoted above. It is definitely changed in AES 4.1 at any rate.

It is also documented as being defined from AES 4.0 and onwards in the compendium, *but* here it is said to have the message code 90 !!! Not 80 !!!

This change from 80 to 90 was therefore not included in the usual summaries of AES version changes, and that has caused he present conflicting usage.

For 90 is indeed the code that modern (if that is the word) MTOS does use for CH_EXIT messages, and so do all the newer contenders, since they base their coding mainly on compendium information.

Unfortunately you seem to have relied on the info Atari sent to developers and that information was in this case erroneous.

In the meantime other developers (including you) have continued the TOS development after the 'demise' of Atari and some saw a need for more functional cooperation between multitasked APPs, and especially for the exchange of data via clipboard (a long neglected system feature).

Some of them have agreed to use the 'free' message code 80 for a new AES message SC_CHANGED, whereby an APP can tell all others that clipboard data has been updated and hint at what it now contains. This feature can be made to work in *all* AES versions, since it is a message handled by the APPs, provided of course that the AES and other APPs do not interpret the message as meaning something else.

That is where NeoDesk and other of your APPs can go wrong however, since they were compiled/assembled with the old Atari definition according to which SC_CHANGED should mean CH_EXIT.

If you wish you can easily fix this, simply by recompiling those softwares with the new definition for CH_EXIT = 90, which will also add compatibility with many APPs that depend on this code to recognize the termination of child processes. Many Internet clients (for example) really need this.

For your information I have also added the best doc I could find on the SC_CHANGED message, and have translated it from the original German. Note that there is no need for you to add any recognition or support of this message to Geneva, since it can be handled entirely by APPs.

----- SC_CHANGED documentation -----

SC_CHANGED (80)

This message should be sent by a program to all other applications in the system when it has altered the contents of the GEM clipboard.

message[0] through message[2]

These are used as for other messages

message[3] File format description

0x0000 = unspecified data
0x0001 = Database data
0x0002 = Text data
0x0004 = Vector-Graphics data

0x0008 = Bitmap-Graphics data
0x0010 = Spreadsheet data
0x0020 = Samples, MIDI-Files, Sound

The format 0x0000 should not be used except when necessary.
(When no other standard type fits.)

message[4] with message[5] 4 characters describing file type

This specification should be as precise as possible, meaning
that if the real file type is ".RTF", then that should be the
specification in this field too, not just ".TXT" even though
such material is a kind of text.

message[6] reserved, 0
message[7] reserved, 0

----- End of document -----

I hope you take this info as it was intended. I'm not trying to
pressure you into any new releases, though I do hope that you will
be motivated to make such anyway by this information. It is after
all rather important for Geneva to use the CH_EXIT message in ways
compatible with most modern APPs.

> 2) STING/DIALER problem?
> 3) Configuratiin problem?
> 4) Me problem?

None of the above I think. ;-)

It sounds more like either of these two things.

1: A really bad, or somehow disturbed, phone line.
2: A really unstable modem pool to your ISP.

In either of these cases it might help if you prolong the interval
during which the modem will tolerate temporary carrier loss without
disconnecting. But it is not certain to help, as the other modem
also has a similar timeout, and may 'kick you out' anyway. If so,
you need to speak to your ISP people about that, and convince them
to set a reasonable timeout value.

The precise way of setting this constant may vary for different
modems, so consult your manual before trying anything.

On my USR 56K modem the setting is stored in S10 as 10ths of a second
with a default value of 7, so if I wanted to change it to a full second
I would use the command "ATS10=10".

Hi again Jo Even,

on Thu 20-05-1999 10:25 josk@my-dejanews.com wrote:

----- snip ----- re: system bombing when reading NEWDESK.INF

I know of some definite cases where a NEWDESK.INF can cause bombs

1: It can contain garbage for some data that must be correct for the
TOS to continue functioning. (Even some spaces are important.)

2: It can be too large. All TOS have a ridiculously small area that
is reserved for reading in the NEWDESK.INF file, and yet it is
read into that area without any size checks whatever, and there
are sensitive AES/Desktop variables immediately beyond that area.
The standard reserved area is appx 4200 bytes. It can be extended
by some special utilities by Martin Osieka (GEMRAM + SHBUF).

3: It can contain settings that are 'unhealthy' for your system, even
though they are legal. For example, it is not really a good idea
to disable caching while using a very high rez on a Falcon. That
in itself can be enough to bomb an unaccelerated Falcon.

Given your description of the machines it struck, and that it did not
strike the Falcon, I strongly suspect variant 1.

Your description makes it sound as if you are using the *same* NEWDESK
file on all these machines, probably having copied it from the Falcon.
If so, then that is the whole problem. It is only the names of the
NEWDESK.INF files of these TOS that is identical. Each of them has a
slightly different format. TOS 2.06 and TOS 3.06 use almost identical
files (but not quite), but TOS 4.04 has many differences, and so does
the MultiTOS desktop. They should NEVER borrow files from each other.

Check the resolution codes (the #E line) in particular, as illegal
resolutions are guaranteed free tickets to bomborama.

There's no cooperation involved, simply that you can have both IConnect and
STinG loaded at the same time, you will have to make a connection with the
appropriate dialer for your connection. Olivier Booklage's latest CAB
overlay will work with either an IConnect or StinG connection.

Can't see anything wrong with it, except for the fact that it'll be "with you after the year 2000" and I wonder if 600usd is a good price for a 486 palmtop by then, even more when you have to trade in your Portfolio for it. Pentium palmtops are all over the place nowadays, and by the time you receive this 486/33 beast, the pentium ones are probably pretty cheap, let alone 486 ones.

They nicely list all the specs that make that new palmtop kick the Portfolio's ass, just the one thing I miss in that little spec list is the price comparison (what does a portfolio cost nowadays, 25usd?) :)

Oh btw, you moved towards Intel when you bought the Portfolio, so it's too late for moral issues anyway. ;)

Maurits.

U have a lot of stuff on the scsii system. It is quite common even on the orriginal Mac Scsii (Apple invented Scsii btw) that as the system neared it's limit it started to go a little flaky. I missed the start of this but did u reciently add a new scsii drive ? Also, it all the termination setup correctly for the scsii chain and is the total length of the connecting cable under 1M if it's cheap cable and under 3M if it's better cable (ie. well shielded).

The scsii glitches in the Falcon are quite well known. I wonder if the TT has the same problems until the system is booted (either Magic does something to correct the problems once it's fully booted or once the massive HD use of the boot sequence has finished things improve ...). Have u tried removing drives no needed for booting from the scsii chain to c if things improve ?

It is the problems with SCSII (slow - so Apple say - and limited in reality to about 5 out of the 8 devices - including the host, the TT in this case, for stable operation) which made Apple come up with what they call FireWire - like USB but a LOT faster <g>.

Hi!

I have i ICD Advantage Plus(pro) St dma->scsi card .. currently there is

a 40 mb scsi drive connected ..
i tried a 540 mb scsi hd and the drivers weren't able to find the disk
.. so how can i fix this ? do i need a
newer os for the controller or just a new driver ? (and where can i get
that ?)

seers,
felix

Some of you might remember that MagiC ate the boot-drive on my Falcon a couple of months ago. What happened was that MagiC wrote its boot-log all over the place, I found pieces of it in mint.cnf, some n.aes binaries, the gemsys-folder... Now, MagiC has never really worked on my Falcon so I just assumed that it was just another Falcon-problem. I deleted it from my Falcon, but kept it on my TT since I've never had any problems with it there.

But guess what happened on Tuesday? Right, suddenly I was unable to boot my TT because - you guessed it - MagiC's boot-log was all over the place. This time it had trashed the FAT as well, so I had to restore the entire partition.

Has anybody else experienced this? I was (didn't reinstall it) using 6.01, with NVDI 4.12 and HD-Driver 6.30, the Falcon was running NVDI 5.01 and HD-Driver 7.12 when it happened. MagiC has trashed partitions on my Falcon many times before, but it has never happened on my TT with previous versions.

Did you disable parity on the new drive? Is the new drive terminated?
What brand/model is the new drive?

>and we'll talk??

I just thought I'd mention that I can run Amberstar on my Falcon.

The MAIN.PRG does not work though, so I have to start the AMBRSTAR.PRG itself, and it needs the caching to be off. And of course, I must boot with my CT2B switch in the off position too. I only installed it to help another guy to get it up on his TT lately, so I don't remember all details now, but I think the INTRO and EXTRO stuff works too, provided that they are run separately, not from the MAIN.PRG.

I haven't played very far into the game, so I have no idea whether it works all the way, but it never bombed or froze on me.

This rings a loud bell for me. The new hard disk driver may be innocent.

Your older problems may have been due to AHDI's well known inability to
deal with large hard disks, and I am also uncertain how well HDDR 7.1 can
do it, but the new version *should* have this ability. So the remainder
of what I have to say only applies to your latest problems.

The big question is: Do you use the MagiC 6 feature of using a boot log file ?

I did that at first, and experienced many strange problems, but after a while
I began to see a pattern in it. The ruined files where always such that were
opened and read during the boot process, and the garbage that overwrote them
was not random garbage at all, but text that should have been sent to the
boot log file.

Apparently MagiC can become confused as to which file it should write to
when \AUTO\ folder programs also open files during the boot. And if that
confusion gets sufficiently bad it could start writing the file data to
folder sectors (internally folders are like files), and that would trash
those folders. Fortunately that did not happen to me, but I did have a
lot of files trashed before I realized what had been going on.

I've turned the feature off permanently to avoid any risk of more damage.
(Just erase the 'log=...' line.)

Possibly your problem is due to something else, but it could be the same.
If so, just editing your MAGX.INF like I did will fix it.

>I've recently upgraded to v1.20 of STiNG, and its all been working fine,
>until today, when I noticed "DNS cache load failure" coming up in the auto
>sequence. This has not been happening before now.

This means that the RESOLVE.STX could not load any cache data from the
CACHE.DNS file in the same folder as itself. It should then create a
new file for you, and start from scratch. This message is not really
an error message, as it is legal to start without any cache.

>I've recently added Extendos to my Auto folder, as I now have a CD-Rom
>drive, but I made sure that STiNG is still at the end of the sequence.

There should be no conflict between STinG and ExtenDOS, so don't worry
about that.

>What is the DNS cache?

It is two things. A mandatory cache in RAM, and a copy of that on file
CACHE.DNS in the same folder as RESOLVE.STX. The file is optional, so
if you ever get garbage in it that causes trouble, just erase and reboot.
If present at boot the file data will be used to initialize the RAM cache,
and if permitted by "DNS_SAVE = TRUE" in DEFAULT.CFG all changes in the
RAM cache will also be written back to the file for future boots. This is
the recommended usage, as it can save a lot of time.

>What does it do?

The DNS cache stores all results from queries sent to the nameserver, so
that symbolic addresses can be resolved locally without having to send
identical requests over and over. The results are timestamped and will
be purged from the cache when the validity time is exceeded. Normal
validity periods are 24-48 hours. So if you take a few days 'offnet'
the resolver will normally purge the cache anyway as soon as it has
loaded the file when you boot up.

NB: This relies on real time clock. If you start the system with random
time settings, then it is likely that the cache will be erased very
often, so that you miss some of the benefits of having the cache.

>I still seem to be able to use the Net; email, web and FTP seems unaffected.

That is quite normal when restarting the cache from scratch.

>Should I reinstall STiNG (or just the DNS part)?

No. This is nothing to worry about.

The disk have 7 partitions with about 460+ Mb on every partition. Apparently
AHDI handle this size quite well, in single TOS, that is.

>
>The big question is: Do you use the MagiC 6 feature of using a boot log file
>?

Yes, I use this feature in the Magx.inf file, but somehow, MagiC is not
always making this log file? Don't know why, but it never did it constantly
on my setup, not on the smal drive either.

>Apparently MagiC can become confused as to which file it should write to
>when \AUTO\ folder programs also open files during the boot. And if that

Sounds like something I experienced my self! What confuses me is, that some
apps. like for example ImageCopy, will not run under MagiC, but terminate
with error 69, what ever that is. But under single TOS there is no problem.
That is on the big drive, on the small drive ImageCopy runs well with MagiC
and TOS.

>I've turned the feature off permanently to avoid any risk of more damage.
>(Just erase the 'log=...' line.)

I'll try to experiment with this. The few log files I have seen didn't teel
me anything anyway.

>
>Possibly your problem is due to something else, but it could be the same.
>If so, just editing your MAGX.INF like I did will fix it.

Well,- for the moment, MagiC will not go past the Magxboot32.prg, but stop
with a black screen. Nothing more happens and I have to reboot the machine.

The funny thing is, that MagiC is very stable on the old 130 Mb drive, and I
like the MagiC multitasking and the speed of NVDI.

I am beginning to wunder, if MagiC like big harddrives at all or maybe it can't cope with this kind of space.

cheers

I don't know how clever this is, this question has been raised on the
Afterburner-list a couple of times and the answer has always been the
same: Removing the 030 will result in a dead Falcon. I don't know why
though...

Btw. a broken pin on the CPU is not fatal, Geir Vï¿½lidalo broke two (2)
when he installed his AB and managed to fix it with one strand of wire
from a piece of multistranded wire, a 15W soldering-iron and some
super-glue.

Ahh, so it's not just me! :-) It has happened on both my Falcon and my TT,
and in both cases it destroyed both mint.cnf and N.AES so naturally I
started to wonder ;-)

If you run a memtest you'll see that the CT2's fastRAM-access isn't any
faster than the AB, so if you bought the CT2 just for that you'll be
disappointed ;-) The extra RAM probably helps though, so does the much
faster 16-bit bus since you (IIRC) doesn't have a graphics-card on that
Falcon.

From: jimsmith@zetnet.co.uk
Message-ID: <374d8139$0$10481@news.zetnet.co.uk>
Source record: 78036

Hi All,

I was just checking the HD Driver page last night and spotted that versions after 7.1 now have support for DVD-RAM drives.

Does this mean I can now go to a local PC computer fair and pick one of these up dead cheap, plug it in, and play DVD movie disks ?

Having seen the speeds that MPEG movies play on my 14 Mb Nemesised Falcon, (without sound) I find this hard to believe !

Not having actually examined one of these disks, what format are the movies in ?
What could be used to play them on our platform (if it is possible) ?

Here's hoping......

Jim.

3555. *-* Mega Disczine *-*

Newsgroup: comp.sys.atari.st
Date: 1999-05-27 00:00:00 UTC
From: Chris Swinson <chris-swinson@mega-disczine.freeserve.co.uk>
Message-ID: <7ik1ff$9n1$1@news5.svr.pol.co.uk>
Source record: 78037

Hi all,

For anyone how as seen Mega disczine then you are more than welcome to join out mailing list. Please see my site at ....

www.mega-disczine.freeserve.co.uk

Please find at the base of the main screen the subscribe box. This is my "new" site and is still undercostrucion, if you find any broken links you can try my old site at....

www.users.zetnet.co.uk/mega.disczine/

You should also find the first 3 issues of Mega on my new web site.

Rather a lot of people have had problems regarding issue 1 and issue 2 in relation to the mouse and keyboard not responding or they were unable to unpack the files correctly to the floppy. This list will come in useful to anyone who has had such problems. Issue 3 was corrected in all these matter but going by the amount of "complaints" in running issue 1 and 2, this list should help you all out.

Due to a problem with my PC (yup I'm a bad boy arn't I ?!?!) I lost most of the files which had been linded up for the next issue. This of course means that issue 4 will be released a little latter than was expected. If you would like to contribute anything at all then please feel free to E-mail me , or post your comments to the mega list.

We are currently planning a STOS "quiz" in the near future. Most of these will be simple projects to help beginner problem solve and get used to how all the STOS commands are used. The first "tutorial" is underway at the moment and most STOS users should be able to solve the puzzles we set to you. Its for fun, advanced uers can also join for the fun as well if they wish , though you may not be interested in the beginners tutorials at this time.

Once the list is setup and running how we want it , with more users also we already have a handful of users already even before this post) I'll start to post the files. These files are only simple (small) files so you should not have to worry about long downloads. You will receive 1 zip file which will contain 2 files, one will be the STOS .BAS file for you to work with, the other will be a compiled .CMP file which will be the working code which you must make the basic program do. Once you think you have done it you can post back to me your ammended files for evaluation. I will also be posting on the list things like the "top ten fastest coders" . Ok, maybe its not fair to people who don't have much free time but we can work this out at a later date. Should anyof you need any extra help then just post to

the list and I'll help you, others users will also be able to see what everone else write so we can all learn as a group.

As said before, its for fun and to learn STOS. You can subscribe and unsubscribe anytime you wish. If you need any further information of questions then please E-mail be.

Keep STOSing....

ST RAM access should be back to normal speed.
The Expose is probably the limiting factor anyway as far as frame rate goes. It will be nice to break the 64mb barrier however. Apex, when filled to the brim, likes to crash a lot. 128mb should leave plenty of room for editing. My Aiwa dual standard VCR has a very stable output at 1/2 speed allowing full screen captures basically at 24fps. There are usually only a few duplicate frames that have to be edited out because there is no SMTP timing.

I glanced at the manual for the CT2 today, and was pleasently surprised that they elimated the GAL chips on the Falcon motherboard. Wizztronics had tried to do this, but didn't have much luck. Kudos to Centek. There is also no buffer mod needed, I guess, unless you have problems with DMA. I wish someone would have done an 060 card like this.

What the person was getting at is that the Atari doesn't have the BIOS
in the same sense as a PC does. BIOS = Basic In/Out System. It's not
responsible for sizing the computers memory.

Yes, he was right about that, but it will be raised in future releases.

----- snip ----- re: some TCP bugfixes that didn't help

Actually the DEF_RTT problem probably masked the problems Peter was working on so that you could not see any difference, even when there was one. TCP is a rather complex protocol, and there are still some things in STinGs implementation of it that can (and will) be improved.

----- snip ----- re: your speed improvements with higher DEF_RTT
>
>Ran another batch to my ISP, 8 emails coming in where the cps-rate

>cps rates for Newswatch... All the emails were small ones (2000-3500
>bytes), so I figure on longer ones the cps-rate will go over those figs.

They should be, as there is an extra overhead for each mail both for TCP work and for file storage, some of which is the same for very small files.

>Anyway, I'd recommend to anyone still using this default value of 50 to at
>least shove it up to 200 or higher.

Definitely, except possibly those connected directly to an ISP system by a NULL-modem or Ethernet adapter. Then responses *are* that fast anyway.

>The strange part is: obviously it didn't affect cps-rates on CAB, Newsie
>and *downloading* with aFTP...

Actually it must have, though not as much. Partly because ISPs normally assign different timesharing priorities for different tasks. Thus we can expect quicker response for HTTP connections, and for FTP download, than we can expect for FTP uploads and mail sending. Also, the low DEF_RTT value caused congestion by retransmission of *outgoing* data, and there are far less outgoing packets in normal HTTP browsing and FTP downloads. So it is not strange at all that such operations were less affected.

I strongly suspect something of that sort, but I can't test it since I don't
have that screen driver.

>RA>That is why I suggested checking with different \AUTO\ and ACC setups.
>
>Do you know the number of AUTOs and ACCs active on my machines?

Nope, of course not, but I myself have appx 3.4 MB in 130 files in my own
AUTO folder, plus a large number of ACCs to choose from, so I know how hard
it can be. Still, sometimes no other method can isolate the problems.

>This would be a

>47 K ; following some recommandations, I've changed them to 1.8K :
>wrong value it seems
>
>So, what is the good one ?

That depends on what peak amplitude you need to feed to those inputs
without getting any clipping effects, which will occur if the output
of the amplifiers in IC U9 are driven too 'hard'.

The resistors you mention are used as feedback for those amps, and the
input resistance is 10k. This means that the original gain was set to
appx 10, which was fine when expecting microphone signals. When using
some more normal source however, that needs to be lowered, by lowering
the feedback resistance.

These amps are fed by a supply voltage of 9V assymetrical, so max peak
rms voltage on their outputs is appx 2.8V, and at that level serious
distorsion may already have set in, as the large-signal response is
not as fast as small-signal response is (so we get TIM at high levels).
Obviously the situation is even worse for high speed transient peaks.

The value 47k for feedback means a gain of appx 4.7, so the input signal
must then never exceed 600mV rms to avoid clipping, and should be even
less to avoid TIM

On the other hand, using too low gain in the input stage worsens the S/N
ratio, so that amplification in later stages brings out more noise, which
is further worsened by digital noise as the signal is AD converted at the
low amplitude.

I think that the latter is what you describe as having to use max level
from your mixer to get correct recording on Falcon, so I would recommend
that you try higher feedback resistor values. The values you need will
probably lie somewhere in the range 5k-20k. Just remember to leave a
little extra voltage room for transients.

Well, perhaps your DEF_RTT setting already matched your ISP then. In such
cases there won't be much improvement from tweaking it of course. Note
that there is normally very little improvement for local connections anyway,
as these usually have very short roundtrip delays.

>Pardon me for changing tack, but a week or so back there was a suggestion

No, not as far as I know, and as long as none of the supposed problem details
are available, I am forced to regard it as an empty rumour.

Hi Alan,

on Tue 18-05-1999 11:00 Alan K. Wortham wrote:

>I've recently acquired a Mega ST2. It has a AA battery case on the Hard
>Drive case as well as the CPU box. What are these for?

The battery case in the Megafile case is just a remnant of the fact that
Atari saved some bucks by not designing a brand new plastic mold. They are
very expensive, and it was lots cheaper to reuse the one for the Mega ST
case top, with minor changes on the sides.

The battery case in the Mega ST itself is for the batteries that drive the
realtime clock. Any fitting 1.5V batteries should do fine.

>Also, how do I tell which version of TOS it is running?

Unfortunately the desktop itself does not show TOS version code in any
of its dialog boxes. It only shows some development dates, and I don't
remember the crucial dates right now. (Others here probably do.)

If you have any tool that can display RAM contents in hex format, inspect
address 2 and 3. Those two bytes hold the TOS version number in BCD form.
The combined value will normally be one of the following:

$0100 TOS 1.00 Very old. Not quite safe for use with harddisk.
$0102 TOS 1.02 Rather old. Safe to use, but very inefficient.
$0104 TOS 1.04 Good enough. The old standard TOS for ST systems.
'' This is the best choice for games and demos, and
'' can also handle serious work very well.
$0206 TOS 2.06 Terrific. The new standard TOS for ST systems.
'' Best for serious work, but incompatible with many
'' games and demos (mostly their fault, not TOS's).

Upgrading to TOS 1.04 is easy. Some variants exist, but in most cases
you just pull out the old ROM/EPROM chips and plug in the new ones.

Upgrading to TOS 2.06 is harder, as the new TOS does not fit in chips that
can be installed in the original TOS ROM sockets. (Upgrade kits exist.)

>difference. My computer is a Falcon with Magic 5.04 and NVDI 4.11.
>Does anyone have similar experiences or a suggestion? I'd appreciate
>it.

Well I have neither of those, but I do have some important info, which
is that the very same things (almost) work fine here. I use OKami 2
with Everest as editor and mostly use it under MagiC 6 with NVDI 5. My
system is an accelerated Falcon with 14 MB ST-RAM and 32 MB FastRAM, but
I don't think these system differencies matter in this case.

Things to consider:

What desktop do you launch OKami from ? I use Thing 1.27
Do you use any enhanced screen driver ? I use VI 2.04
Do you have any other active tasks running when this problem strikes ?
If so which ?
Do you have 'exotic' ACCs or autoAPPs running ?
Does the problem strike when you boot as 'clean' as possible too ?
Does it strike even in singleTOS ?

>this will obviously not work.

I thought so. That settles the question of whether or not Derryck's CPU pin
was broken (like he suspected it might be) or not. It also means that if it
does break eventually, some drastic measure will be needed.

Since the original CPU completely releases the bus when that pin is grounded
(as for CT2B installation) one perfectly feasible fix for a broken pin would
be to simply cut that chip out completely. Carefully cutting *all* its pins
I mean, and throwing the chip itself in the waste basket.

That might be a good idea anyway, as it should reduce power consumption.
Why feed a CPU that is no longer used ?

there're just a few points I want to correct in your reply to Alan.

on Tue 18-05-1999 19:14 Steve Stupple wrote:

>The model's I've come across have all been TOS 1.4 Rainbow TOS (or
>1.04). IIRC 1.4 was the first one to support the blitter!

No, that's not quite right. In fact the Atari nickname for TOS 1.02
was 'Blitter TOS' (just like TOS 1.04 is 'Rainbow TOS').

Also, quite a lot of Mega ST machines were delivered with TOS 1.02,
because it was the first TOS to function reasonably well with hard
disks, and these machines were intended for the 'serious' market.
Later TOS 1.04 naturally replaced it, since it is even better, but
by that time a lot of Mega ST machines were already 'out there'.

>Anyway, if you go to the 'DESK' selection on the menu bar and look at
>the copyright dates the following is what version they match.
>
>I am doing this from memory, so please correct if I'm wrong;)
>
>1985 = TOS 1.09 ROM based.

Typo ? That should be 1.00 of course.

Oh, no, I'm definitely not inferring any pressure on your part.

This is a problem I've known about for some time, and one that is actually addressed in Geneva 006 (it uses 90 instead of 80). The problem is that NeoDesk (which we have no current plans to update) still relies on 80. Geneva 007 has some special code built into it to detect what version of NeoDesk is running and actually fix this message for it. I just haven't had the time to create the patch for US users yet.

When the decision comes down to either consulting for big $ per hour, or writing a patch program that will be released for free, I'm afraid the $ wins out :-)

I do have to wonder at the decision to use 80 for SC_CHANGED, with the knowledge that it was at one time reserved by Atari for CH_EXIT. They really should have chosen some other number, IMHO.

tried
> to connect a new CDR.

I'm not sure about the particular Quantum drive, but some don't work properly with Cubase Audio when you've activated the arbitration (which is needed when you use a CD-writer), so could that be the problem? If so, just de-select the arbitration option in your harddisk driver or an NVRAM configuring program (or use a program to reset the NVRAM).

> Is it possible that I may have damaged my SCSI Interface when I
> disconnected the cable?

You always have the risk of damaging the computer if you connect/disconnect external units with the power switched on (that's why they warn about it in the user's manual). I've seen many examples of this during all my years as an Atari service technician - it's much more common than people think...

> Is there a prg to test the Falcon system for SCSI interface
> problem? It is not a termination problem because my Quantum is inside
a metal
> case and I did not change its termination which is on as it is the
last drive , I connected thisone only
> as a test. When I scan for IDS it reports "Unit 0 not responding" or
> CH/Atari Megafile"

Which harddisk driver do you use?
If it's an unpatched AHDI, you won't find any drives if unit 0 isn't connected or doesn't respond for one reason or another - the driver won't continue to scan for the rest :(There is a patch program available, which changes the AHDI driver to scanning for all or selected units.

Just about any electronics store should have them, but since I'm not
from the UK, I haven't got a clue about where to find them there -
they're rather easy to get hold of here in Sweden though... ;) They cost
around UKP10 or so here...

DVD-Video requires the use of MPEG-2 decoding hardware (among other
things).

> Having seen the speeds that MPEG movies play on my 14 Mb Nemesised Falcon,
> (without sound) I find this hard to believe !

DVD-RAM is a different format than DVD-Video. DVD-RAM is essentially a
high-capacity (2.6GB per side), rewritable CD, backwards-compatible for
reading other CD formats.

[Lots of relevant stuff deleted!]

What is strange about all this is that I have hardly no problems at all
with Geneva+Neodesk. I am running STinG with Popwatch, Newswatch,
CAB2.5, Aftp, Okami, QED, etc. And almost everything works perfectly.

I can use the clipboard to capture addresses in QED and paste them in
CAB. The opposite also works. Neodesk does not complain at all.

I can drag files from a Neodesk to an Aftp window but the other
direction does not work. Hve to use the GET command instead.

The only real problem I have is related to how Okami calls ttp
programs. Starting OEXPIRE, OIMPORT or OEXPORT from within Okami leads
to instability later. PGP.TTP used to crash heavily before but since I
changed from lower to upper case filepaths in O.INF it kind of works.
The TOS2GEM solution does not work properly (no redraws when the TOS
program ends etc). Best would have been if Okami launched the TOS
programs in GNVA_TOS.PRG like Neodesk does. I have not talked to Jos
den Bekker about this as it does work perfectly as long as you avoid to
have Okami start other programs. QED.PRG has never showned any poblems
when started from within Okami.

>"Judy Jetson" (or was it Jane, his wife). I have never in all my travels
>run across this game. Does anyone know if it really existed and it archived
>on some ST site on the web?

Well, I remembered that game as well, and dug through my SyQuest cart archives of ST games, and found it. I put it up on my web site if anyone is interested.

The URL is in my signature - just follow the ATARI computing link to get to the game. Keep in mind that the Atari computer section of my web site is very much "under construction" at the moment (as is my site in general), but don't let that stop you from grabbing the game. And I put a couple other games up too: BLAT and POKER DICE.

Enjoy!

-Paul

I've never had this misfortune, but about the first thing I did with
Magic 6.01 was to disable the boot-log and opening screen. As I use
both a boot selector and NVDI's device selector when booting to TOS,
it's not a lot of help seeing what went on afterwards.

Without a boot-log, Magic 6.01, NVDI 5 and HD Driver 7.xx have behaved
impeccably on my MSTe. On the TT with HD Driver > 7.00 I've had the
problems with booting that I have been describing under another thread
but the only problem with files that I have sufferred during booting
is the occasional disappearance of MAGX.INF

>
> chrisc
>
It's about the size of the A/B. It has it's own PGA 68030 running at
16/32Mhz (I have it working with Nemesis at 40Mhz). It uses 8-4mb 30 pin
Toshiba 60ns simms. A Falcon will bench about the same as a TT (at
32Mhz), except for floating point, and that depends on how you have your
FPU clocked.
I have had this card for quite a while, and it is very reliable. The
only compatibility problems are with applications that cannot run in
fast ram. It uses two software switches in the autofolder to enable the
fast ram and clock speed. The memory is mapped at the same address as
"real" TT ram. Works fine with 14mb Falcons. Has pass through connectors
for additional cards. Requires the buffer mod to be installed in a
Falcon. I can't think of anything else. It's not near as nice as the
Centurbo, but it's pretty fast and easy to use. Installation isn't to
bad, but you do have to be able to solder about seven wires, lift a
couple of pins on the CPU and recase your Falcon. FPU clock speed is
touchy. It took several clock speeds before I found one that worked well
with my Falcon. I ran Cubase Audio with the card installed, except that
Cubase doesn't not utilize fast ram, it worked fine. Right now it is in
my C-LAB Falcon with a NOVA card attached. I have used ScreenEye, Expose
and Falcon Speed with the Mighty Sonic.

Offers.......?

Mike

At Bravo Sierra Computers you'll find Used and New Atari. Items you've been searching for. Item's new to you and Classic Atari long lost. Have you got Hardening of the Ataris? Check out Bravo Sierra Computers! Have you hugged your Atari today? Buy your Atari & yourself a present today! Buy from someone with 16 years of Atari experience. Buy from someone personable, polite & passionate about His Atari! And if I don't have what you want to buy or I don't know the answer to your question, I'll refer you to someone who does. That's the nice thing about the Atari community and my colleauges in the Atari business. We would rather send our business to a fellow competitor to get what they need than have someone abandon their Atari due to lack of support. For myself, I only use Atari! I get on the InterNet with my Atari ST, I use PageSTream for all my DeskTop Publishing, my DataBase is DataManager ST & besides playing games on my Atari ST I play games on my Atari Jaguar with my collection of Jaguar Games! I won't own neither a PC or a Mac. So buy from someone with a servant's Heart & someone who'll be around to offer you Atari support!

atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with NewsGroups.

I've just added to my ST SoftWare Catalog 30 more titles. All brand
new. In my ST software catalog new titles are listed at $15. Just like
BattleZone below. But for a limited time the $15 titles are on sale for
$10. So go ahead and check it out. All of these titles are *NEW. Just
think of this as a "Come spend your Tax Refund in my store sale!".

BattleZone; Atari;
Color or MonoChrome Monitor. One or
two players. Full 360 Degree action.;
*NEW.....$15.00 U.S.

In my case the first files that were damaged were always files that had been
opened and read by various \AUTO\ programs during the MagiC boot, such as
assign.sys, or bdconfig.sys, or various .INF files used during the boot.
Fortunately it was easy to disable the bootlogging, so I have no problems
with this anymore
.

Ok, but I still recommend some more modern driver.

>>The big question is: Do you use the MagiC 6 feature of using a boot log file
>>?
>
>Yes, I use this feature in the Magx.inf file, but somehow, MagiC is not
>always making this log file? Don't know why, but it never did it constantly
>on my setup, not on the smal drive either.

WroooonnG !!! :-<

If you ask it to log then it does log, always, that is part of the problem,
as it somehow forgets how to do it properly, and therefore writes the log
data to the wrong sectors.

----- snip ----- re: more on how bootlogging trashes the boot disk
>
>Sounds like something I experienced my self! What confuses me is, that some
>apps. like for example ImageCopy, will not run under MagiC, but terminate
>with error 69, what ever that is. But under single TOS there is no problem.

Eh ? I can't remember having any such problem, but I'll test it right away
just to make sure. I just dropped a 130 K JPEG on ImageCopy, and it had no
problems, and when I exited and then restarted it without arguments that
also worked fine. So on my system your problem does not occur.

This could of course mean that some of of thw ImageCopy file may have been
trashed by the bootlogger, so that the program bombs for that reason.
(Executing ascii code as 68030 opcodes can't work very well.)

>That is on the big drive, on the small drive ImageCopy runs well with MagiC
>and TOS.

So two originally identical files no longer work identically you mean ?
If so, I suggest you compare them with Egale to find out for sure if
they really are identical.

>>I've turned the feature off permanently to avoid any risk of more damage.
>>(Just erase the 'log=...' line.)

>
>I'll try to experiment with this. The few log files I have seen didn't teel
>me anything anyway.

They just show exactly the same text that you see on screen when booting
normally (without logging that is).

>>Possibly your problem is due to something else, but it could be the same.
>>If so, just editing your MAGX.INF like I did will fix it.
>
>Well,- for the moment, MagiC will not go past the Magxboot32.prg, but stop
>with a black screen. Nothing more happens and I have to reboot the machine.

I think your disk data has already been so severely damaged by the logger
that you will have to repartition it and start over, or at least wipe the
damaged partition(s).

>The funny thing is, that MagiC is very stable on the old 130 Mb drive, and I
>like the MagiC multitasking and the speed of NVDI.
>I am beginning to wunder, if MagiC like big harddrives at all or maybe it
>can't cope with this kind of space.

I think it can, at least when helped to do it by a modern driver.
AHDI which you use is not at all adapted for Multitasking, such as most
modern drivers are, so AHDI most likely makes all problems worse.

But the prime cause of your problem is the bootlogger. If you wipe the
damaged partition and reinstall MagiC with the logging turned off this
time, then I think everything will work much better, even with AHDI.

But actually TOS doesn't need any of them for recognizing added ST-RAM,
as this is done before bios and xbios are initialized.

----- snip ----- re: my intentions with my post on CH_EXIT vs SC_CHANGED
>
>Oh, no, I'm definitely not inferring any pressure on your part.

Good. It is so easy to cause a misunderstanding by a problem report, and
it can take a very long time to sort out the real issues then, so I am
glad we were both spared that.

>This is a problem I've known about for some time, and one that is actually
>addressed in Geneva 006 (it uses 90 instead of 80).

Ok. That means that those APPs which have workarounds for the old CH_EXIT
code should skip those when identifying Geneva as being version >= 006.
In other words: when the value of the "Gnva" cookie is larger than five.
Right ?

>The problem is that
>NeoDesk (which we have no current plans to update) still relies on 80.

Yes, which is one of the reasons it doesn't work well under either MTOS
or MagiC. :-(And that is why I don't use it myself. I need a desktop
that can work more or less the same way on all (or nearly all) newer
TOS multitaskers, as well as singleTOS.

Unfortunately no Desktop I know of can quite manage this, though Thing
does come close, failing only under Geneva AFAIK (even with version 006).
It starts up, but does not work right unless MiNT is also installed.
I think this is mainly due to lacking recognition of Geneva in Thing,
so that is not really your problem of course.

>Geneva 007 has some special code built into it to detect what version of
>NeoDesk is running and actually fix this message for it. I just haven't
>had the time to create the patch for US users yet.

Ok, I know how that is. We must prioritize what we do, and that does
mean that some things may have to be postponed indefinitely. My main
concern was that you should be aware of the situation so as to avoid
problems with any future releases. Evidently you already were.

>When the decision comes down to either consulting for big $ per hour, or
>writing a patch program that will be released for free, I'm afraid the $
>wins out :-)

Unfortunately the Atari 'market' is not in the 'big $' league. :-(
But I hope you will find some time for it eventually.

>I do have to wonder at the decision to use 80 for SC_CHANGED, with the
>knowledge that it was at one time reserved by Atari for CH_EXIT. They
>really should have chosen some other number, IMHO.

I agree. Had they chosen 81 instead, all the problems those APPs have
with NeoDesk and Geneva (older versions) could have been avoided, but
it is possible that they simply never knew about it. After all, there
were lots of people, even among testers, who did not read the early
MTOS docs closely enough to catch it. And modern docs such as Atari
Compendium make no mention of this code change at all. So judging by
them it would seem as if code 80 was, and always had been, free.

Hi Kenneth,

on Thu 27-05-1999 23:35 Kenneth Medin wrote:

----- snip ----- re: the CH_EXIT vs SC_CHANGED problems of Geneva/NeoDesk

>What is strange about all this is that I have hardly no problems at all
>with Geneva+Neodesk. I am running STinG with Popwatch, Newswatch,

STinG itself is completely immune to this problem, as it operates below
the GEM system level. The *Watch programs do not normally run any child
processes, nor do they use GEM clipboard so they are not directly
affected either.

>CAB2.5, Aftp, Okami, QED, etc. And almost everything works perfectly.

Here I know you are mistaken. These can fail miserably due to the
message code conflict, even if it does not happen when they are used
as you are accustomed to do. That may also depend on Geneva version.
(>=006 or not) If you have the newer version, then half the problem
is eliminated.

>I can use the clipboard to capture addresses in QED and paste them in
>CAB. The opposite also works. Neodesk does not complain at all.

Well, I had expected it to assume that QED had exited, at receipt of
a SC_CHANGED message, but it may of course avoid this by making security
checks on the message data parts, accepting it as a valid CH_EXIT only
if the child ID is correct. A destop with many children must check
this anyway, to know which of them has 'exited'. Programs that never
call more than one child at a time do not need to check that, as only
the parent process should receive a real CH_EXIT message.

>I can drag files from a Neodesk to an Aftp window but the other
>direction does not work. Hve to use the GET command instead.

That is probably due to some other reason. No child process or clipboard
operations should be involved in that.

>The only real problem I have is related to how Okami calls ttp
>programs. Starting OEXPIRE, OIMPORT or OEXPORT from within Okami leads
>to instability later. PGP.TTP used to crash heavily before but since I
>changed from lower to upper case filepaths in O.INF it kind of works.

This is not due to the message conflict, but to the launching method
used. MTOS and NAES use one set of arguments, MagiC uses another, and
Geneva uses a third variant, which I doubt that OKami supports yet.

>The TOS2GEM solution does not work properly (no redraws when the TOS
>program ends etc).

TOS2GEM should not be used at all under Geneva. It is for singleTOS.

>Best would have been if Okami launched the TOS programs in GNVA_TOS.PRG
>like Neodesk does.

Exactly, and for that it will need to use Geneva compatible arguments
in shel_write.

>I have not talked to Jos
>den Bekker about this as it does work perfectly as long as you avoid to
>have Okami start other programs. QED.PRG has never showned any poblems
>when started from within Okami.
>
But that is a GEM program, so its launching is more similar between the
various TOS versions. The problem is that Jos needs to use a shel_write
call to run TOS programs as well. Only under singleTOS does a simple
Pexec call do the job properly.

Hi Raymong,

It would have been easier to help you if you had mentioned what kind
of hardware board you are talking about. Is it TT or Falcon, or some
add-on SCSI board for ST/STe ?

I do have some comments that are relevant to all variants though.

on Fri 28-05-1999 02:27 guitarra@afn.org wrote:
>
>Transsistor 78L09

That is not a transistor, but a 3-pin IC. It's a voltage regulator
and the last two digits in the name specify the output voltage.

>(thisone is attached to one leg of the L53C8)

I assume this refers to the SCSI controller chip, but then you have
the name wrong. It should be L53C80, and according to Atari a further
suffix to the name is also *very* important. For Falcon that suffix
should be JC2.

The rest of the stuff seems very ordinary components that you can get
in any electronics shop, under the names stated. In some cases though
the last part of the 'name' you use is irrelevant, as it is only some
manufacturer dependent suffix code.

So "2N 3906 M239" is really a "2N3906" etc

It's strange, it's good in turbo mode on my falcon (I use always TOS 7.0x).
Without this modification, your DSP works in turbo mode (you can remove
hardware patch by only remove wire on FPU pin 31) ?
I think to time-out or crashs...

During CT2B tests, I have found a problem (only with my card ? I don't know...)
For exemple CENTBNCH was locked, I have searched problem and I have found :
My DSP clock was bad at 50 MHz (OK at 32 MHz in normal mode) so I have found
a solution, now I use directy 50 MHz clock on oscillator (I have cut signal 11
DSP clock). My DSP is always at 50 Mhz.

DSP interrupt is only used by Aniplayer and Quincy (maybe for demos or games...),
this modification have same results in normal or turbo mode. It's only for
remove patch in Auto-folder.

>I believe this is because cumulative delay, from the time that the CPU sees
>the IPLx signals until the XHACK and DSACK0 signals begin to respond, is
>simply too long. This would require that the CT2B insert some waitstates
>before generating the bus error that causes 'spurious interrupt' state.

Delay isn't important because 68030 wait DSACK0 signal during 4-6 uS
(watchdog delay on CT2).

>As it is I can't even get it to work when using 74F instead of 74LS, so

I use a 74LS05 an inverted gate with open collector output (more important
for CT2 !) In final stage 2 gates are in // for drop low level.

>Does the problem strike when you boot as 'clean' as possible too ?
>Does it strike even in singleTOS ?

Thanks for your reaction. The problem is already fixed. It never
occured while using Okami 1.34, just popped up with 2. Someone in the
newsgroup suggested to have a look at the line in O.INF that defines
the editor and rewrite that line to lowercase. That's what I did and
it solved the problem. (When shifting from Okami 1.34 to 2 I went
through all the INF-files to see if they needed updating and for some
reason I changed the lowercase line d:\qed\qed.app to upppercase,
don't remember why :-/).
Regards, Joost.

Never tried it. I always print mono A4 (on a laserjet) but I did have a problem once with Papyrus not printing to the bottom of a page. This seemed to be something to do with the printer settings. I don't know why the printer did not initialise to A4 but I fixed it with the LaserJet 4P CPX. If both the program and the printer are set to Legal then it ought at least to print Legal.

As for the 4 colour separation I suppose that depends on your program and I can't help much there. Are you talking about a colour laser? or do you want to print each colour in black and white? (not that it probably matters if all you want is each colour printed separately).

TBF, if you don't know how to sourece these parts yourself then you might
well lack the experience required to work on a multi-layer board like the
Falocn. Get it wrong and you might well kill the whole thing....

No, it will need to use AES 4.x compatible arguments in shel_write().
There was a problem with running TOS programs via shel_write() with
Geneva prior to 005 (they were run directly, i.e. without GNVA_TOS, when
you didn't use the "autodetect application type" mode), but with 006,
there's no need to use any different arguments to shel_write() as you'd
use for AES 4.x.

Ciao

Define "work right" ... Thing 1.27 should work with Geneva 006, and
besides, why should it need to recognise Geneva? If the OS is AES 4.x
compliant and supports appl_getinfo() properly, there shouldn't be any
need to specifically recognise it.

Hello Mario hello friends:

Well, there is no way I can get my scsi port to work and I tested everything so,
it has to be hardware :(

I am going to start by replacing the capasitors (not the ceramic ones)
and then follow with the transistors and if it does not work then will do
the chip.

It is hard to read the parts number and I am hoping Mario and other
friends could help me identify the parts. These are as I was able to read:

Transsistor 78L09 (thisone is attached to one leg of the L53C8)
thsi transistor has also these numbers A 28D JRC

Transistor 2N 3906 M239 (part number Q5 on the board)
Trnsistor 2N 3904 M239 (part " Q4) 2 of these
Transistor 2N 3904 M248 (part # Q6)
Capasitor 47 uF 16 volts

Did I get all these right? Thanks for your help :)
I am planing to start repair tomorrow, please let me know if
I got any missreading on the parts.

Thanks a lot

Raymong (irc nick guitarra)

Well, it turned out to be nuch less serious than I had feared. For a while
there I was unsure of the stability of the CT2B after some hardware mods,
but the system is back to normal again. I was fooled by some socketed chips
that needed a cleanup of sockets and pins.

Btw:
One of the things I did this time was to test the DSP interrupt acknowledge
patch, and the results were not as good as I had hoped. It works fine when
the Falcon is booted in 16MHz compatibility mode, but has no reliable effect
in the turbo modes.

I believe this is because cumulative delay, from the time that the CPU sees
the IPLx signals until the XHACK and DSACK0 signals begin to respond, is
simply too long. This would require that the CT2B insert some waitstates
before generating the bus error that causes 'spurious interrupt' state.

As it is I can't even get it to work when using 74F instead of 74LS, so
it is not due to the delay in that chip (3ns). So for the present I see
no other choice than to accept that it only works right in 16MHz mode.

It's not all that important anyway, as most DSP programs do not use these
interrupts.

Correct, plus another Mega-ST, and some STe and STFM machines too.
But it is only the Falcon which is both fast (with the CT2B), and
capable of really good resolutions. That is why I had to keep at
it until it worked right again.

Fortunately it was not as bad as I had feared. (See other post)
The worst of it now is that I lost a lot of time, and will lose
a lot more to catch up with mail and news again. I've been at the
computer now for an almost non-stop (lessee now) 48 hours appx...

>no other comm programs at all, I use Flash 1.6 BUT that's over on my
>1040ST!

The message saying that another program is using a port does *not* mean
that STinG has contacted that program to check this. It can't work that
way. It is merely the conclusion it has to draw when attempting to use
an HSModem function and instead getting a flat refusal (error code).

This should mean that the port is 'busy', but it can also mean that some
part of HSModem is missing, or wrongly installed or configured.

The normal boot order is:

```
Falcon: TT: ST/STE:
------- --- -------
DRVIN.PRG DRVIN.PRG DRVIN.PRG
MFP_FALC.PRG MFP.PRG MFP.PRG
SCC.PRG SCC.PRG MIDI.PRG
MIDI.PRG MFP_TT.PRG
MIDI.PRG
```

Do not leave out a component just because you don't plan to use its port.
Although no definite proof is available there are very strong indications
that MIDI.PRG 'wants' the position indicated above, and may become 'surly'
if it doesn't get it.

Some terminal programs also get confused if the number of modules in use
differ from those used when you created the settings of that program,
(eg: Connect) and they can then access the wrong ports, causing all kinds
of trouble.

It is best to install the full set appropriate for your machine, and keep
that set active or inactive as a whole, not as separate parts. With STinG
they must of course be active, and STING.PRG must boot after the last of
them.

If you already have things installed this way, then we must instead take
a look at the configuration of the HSModem components.

>Which one? His Falcon/CT2 or TT? What has happened?

It was the Falcon but it wasn't so bad as I then thought. I was testing
the DSP interrupt ACK patch and after one failed experiment I started
getting very weird results for entirely unrelated things. For a while it
seemed likely that I had damaged either the CT2B or some of the custom
chips of the Falcon.

Actually it was just some less critical chips that needed to have their
own and their socket pins cleaned, and some of those contacts 'flexed'
so as to give good connection again. But it took me almost a week
to figure that out, so I'm waaay behind on everything now.

>something is wrong is this math.

Really? I forgot to check his figures earlier.

>Can anyone confirm if I am that bad in math to not understand the logic
>behind this theory?

Ok, let's see. The things being compared are P2, P3, and G3, in order
of speed. Lets test what we get by some naive algebra and arithmetic.

G3 is twice as fast as P2, by the first comparison, so: G3 = 2.0*P2
P3 is 50% faster than P2, by the second comparison, so: P3 = 1.5*P2
Then he says that G3 is 50 percent faster than P3, even though we get
a relation of 2.0/1.5 which is appx 1.33. So relative to P3, G3 is
appx 33% faster. So from this viewpoint his statement is false, but
it can be rephrased to be (sort of) true anyway.

G3 is 50% of P2's speed faster than P3.
He just forgot to adjust to the new referent in the last statement.

The math equivalent of a typo ?

>As the p3 is 50% faster than the p2 ... the G3 is about 50% faster
>than the P3.

That is only natural. Just as it was only natural that 1MHz 6809 and
6502 processors were equal or superior in speed to 4MHz 8085, to take
an example from a much earlier generation. And the reason was quite
similar too. They had a more efficient basic structure, and that was
adhered to thoughout the whole design, whereas an 8085 was a mishmash
of various inconsistent ideas that never quite fit together.
(Not to mention the Z80.)

So, though in a lesser degree in those early times, we have had this
RISC-CISC-like relationship between Motorola and Intel all along.

>IBM have and continue to develop server systems and embedded
>control systems using the PPC chips while Apple have had PPc

>accelerator should not cost more than a new computer !

AFAIK, the Falcon itself is no longer manufactured, so any
'new' units have been in storage for quite a while, and that
naturally affects the price. Around 200 UKP is what most
people seem to expect for a well-used 'old' Falcon.

In any case, we'll just have to wait and see what the final
price and specs will be. IMHO they are making a serious
mistake if they cut the specs just to lower the price by,
say, 50 UKP.

----- snip ----- re: need of adaptive circuitry between Falcon and Tempest
>
>I'm not quite sure what u're getting at here but as two side
>points, the Falcon was designed from the start to allow easy
>implementation of external processor upgrades at, it was

:-)
Dream on, that is a very raw and primitive bus expander that the
Falcon has. It is no more 'easy' to adapt to than a MegaST bus.

The special access requirements for the Falcon's 24bit address map
is not something that the PPc was designed to handle. There will
have to be smart adaptive logic of some kind. All other Falcon
accelerators need this, even when based on the same CPU, so there
is no reason to think that the PPc can make do without it.
But we'll see about that too, when they become available.

>rumoured, Atari planned to release upgrade boards for them
>themselves.

Sure, but that was just vapourware, like so much else they planned.

Second, the PPc chip being used is a 603 which
>has been around for a while and the chips and support
>hardware are now 'out of date' by Apple standards and it is
>all quite cheap.

That sort of situation can be very unstable nowdays. If no
new 'big platform' designs are made based on them, they can
rise very rapidly in price as the existing supply runs out.
This has happened before with other chips.

----- snip ----- re: speedup factor to be expected with Tempest
>
>Well, based on the Apple and Amiga emmulation figures, Core

>design hoped for an emmulation speed of around the same as a
>80Mhz 68030. This, along with the much faster memory access
>of the SDRam should provide a serious boost to the Falcon.

That is true, and I agree that an optimized emulator should be
able to handle that speed, thus making the 'raw' 68030 speed
appx 60% faster than that of a CT2B, which is very good.

But if used optimally, the FastRAM can make an even bigger
difference, as that is where CT2B (and others) have to step
on the brakes due to limitations of the RAM used.

>Also to be remembered is that the Tempest emmulation is
>being enhanced in two directions. First, it is hoped that
>the emmulation system can automatically switch on and off
>per application allowing natice PPc code to run on the
>Falcon - much as the Apple systems did and still do. This

Hoped ? If that were at all likely I think Core would have
made no secret of it, and then you would not have to just hope.
Such a capability does not come of itself, so if it is not
in the current design goals then it will not happen.

>could lead to a number of much faster programs designed for
>the PPc chip that don't use emmulation.

I doubt that this will ever become powerful factor for the TOS
platform. This is inherently based on 680x0 code, throughout
all the TOS components. Of course it can be redesigned for
any native CPU, but such a work investment is not going to
be made for so small a platform.

Native mode might play some role anyway, for superoptimized
NVDI drivers and such things, but hardly for GEM applications.
Just developing/porting the tools needed for that would take
years. (Compilers, assemblers, debuggers, etc.)

>Second, the Tempest
>board should run happily alongside any other 030 and 040
>chips in the system maening anyone with an Afterburner can
>still use it and normal falcon users can still use the 030
>allongside the PPc chip ... dual processing basically.

No, that is hardly possible, for several reasons.

1: They all have to access the basic Falcon facilities through a
shared 16bits wide databus, and the bus sharing method used
for that bus is to halt all bus masters except the one which
is currently accessing.

2: There is no way that existing system software can survive
parallel use by two independent processors. This would
lead to total chaos in the use of system variables and
stacks etc.

3: It would also lead to partly parallel address spaces, making
all pointers from ST-RAM to FastRAM ambiguous.

I could go on but why bother ? Meaningful parallel processing
requires an operating system designed for that, which TOS isn't.
A new operating system, optimized for this kind of setup will
not be developed. No one will invest such work in a potential
market of, at best, one or two hundred users.

Remember, we are not talking of all potential Tempest users here,
but only of such users that also have a suitable other accelerator.

Finally, I believe that the overall system would gain *more* speed
by working for optimized integration of the PPc with the Falcon, and
that requires skipping any extra accelerators as they would only
worsen the 'bottleneck' effect of the interface between Tempest and
Falcon.

----- snip ----- re: more on comparative speed
>
>Under emmulation expect something about the same as a 45Mhz
>040 (rmembering that no other 040 board has SDRam support)

I agree.

>while under native PPc mode (no emmulation) this will be
>dramatically improved. Core design are currently talking to
>a number of developers about PPc native versions of
>programs.

Talk is easy, but development requires suitable tools.
We have no such tools today for producing native PPc code.
They do exist on other platforms, but not with support for
TOS and GEM. Just porting libs would be a *major* project.

>Please note here that I am NOT a member of Core Design, I
>simply know them quite well and read their press releases.

I assumed as much. Had you been inside the design team you
would speak more of definite plans than of 'hopes' in some
of the passages above. I fully understand and sympathize
with your hopes, but I can't share your belief in all of it.

>Ohm it also looks like the Eclipse and Tempest boards will
>also work on a TT with a new board being developed to make
>the TT expansion port Falcon compatable and expected price
>for that will be around 25-30 Ukp. Check the WWW site :)

Nice. The TT has not exactly been 'spoiled' by availability
of any add-ons. But for this to be really useful it will also
require new software and firmware on the main Tempest board,
since there are so many things in a TT, besides the expansion
bus, which is not at all Falcon compatible.

The mapping of both RAM and IO differs considerably, since
the TT has full 32 bit busses for both address and data, and
the internal speed of a TT is therefore near four times that
of a normal Falcon.

Hmm, rereading some of the above, I notice that some may get
the impression that I'm arguing against the Tempest, both
for TT and Falcon, so please let me clarify that I am not.

I belive that it will be a very powerful accelerator, but
I just want us to keep a reasonable perspective of what it
can give us.

It can give a 'share' of the new advanced stuff from 'larger'
platforms, mainly by giving us a faster 68030 than any we can
buy as such. But it will not give us any of the *support*
that exists for those other platforms.

Or why not go the other way around. Find some ISP that will allow you
to use personal PERL scripts, and use that to implement an ISP-based
BBS combining the best elements of HTTP and CGI scripting. One great
advantage of this is that it is cost free (except for effort), as you
don't need any extra lines or anything, and don't even have to be
logged on for people to visit the BBS. And, you can get loads of
users visiting simultaneously (if your scripts are smart enough).

>On a permanent IP address, try www.ez-ip.com . Its a free service that
>will give you a static name to your dynamic IP address. I have the name

Neat. I have been looking for just such a service. That will really
ease the exchange of stuff with some friends of mine, as well as many
other joint network activities of course.

>with the trade in to an Intel 486/33 palmtop

Why not? The 486 as such is three generations behind the new computers,
and there are hordes of 486s around that original users no longer want.
I myself have received two as gifts, and while one of them lacks a disk
and has a PSU problem (This is a laptop model), the other one does work.
(That is a 66 MHz desktop model).

I connected it to the monitor I normally use for my TT just to test it.
But I have no keyboard or mouse for it and since I don't want to spend
any money or effort on PC stuff, I've just let it sit on a bench...

I have been thinking lately that I could use it to test compatibility
of STinG stuff under emulators, but I don't know it its worth it.
I'm far too busy with Atari stuff that I like, to waste time on systems
that I don't like.

Yes, I guess nobody would be very impressed by a Falcon demo
handicapped by not using cache.

>(I gave up after having seen some of the amazing stuff that
>was released...).

Yeah, I know. Some guys spend *all* their time on such stuff,
so of course they get damn good at it, if they have any talent.

To each his own...

I may not be very good at such things (never even tried), but
it would be a damn boring world if everyone was doing the same
things, and had the same tastes etc.

>> Please do. I am always interested in such things, even though it
>
>Will do when I get back from work tonight.

Ok, that should probably be a while ago now anyway, as I've been
sitting here for *quite* a long time trying to catch up.
(Still non-stop since my earlier postings.)

>probably is
>> not applicable on my own system.
>
>Speaking of your system, what's happened with your Falcon?

I think you have already read that by now in earlier posts,
so ask again if there is anything you still wonder about.

----- snip ----- re: Hades memory map with all RAM == ST_RAM

I assume this means also that all ST-RAM behaves like Fast-RAM,
as far as speed is concerned.

>Apparently this memory-model do cause a few problems, it turns out that
>some applications/TSRs has problems with ST-RAM > 14Mb.

That is a bit surprising, as the APPs should not care about such things.
I mean if they continu to use XFRB etc even when not needed, so what.
But it depends of course on *how* the new DMA channels are implemented.
Or more precisely, how 24 bit registers are extended to 32 bits.

The correct method is to make it so that the added register byte is
cleared when any of the other three bytes is written to. Thus it can
only be nonzero when it is the last byte written of the long register.
That means that there can never be any confusion about whether or not
the top byte of the register is valid.

Another potential problem is of course if the Malloc and Pexec do not
differ between the TT-RAM and the ST-RAM area, as it is crucial that
programs that are not at all 32-bit-aware, must be restricted to the
lowest 16 MB area in all allocation, both for program and data. So
Pexec and Malloc must still recognize the TT-RAM flags properly, and
restrict RAM allocation according to them. Otherwise lots of older
stuff may bomb unnecessarily.

Hmmm.. I guess I can FINALLY say I bought a PC.. though it's at the IBM XT level. Hell, I wouldn't mind playing with an Atari PC-1 and Atari PC-5 sometime.
I enjoy the various avenues Atari tried. That's my hobby.

But when it comes to the handhelds, the fact becomes apparent that it was an IBM-XT when I still find a Newton much more useful. :)

But the Portfolio will be a great conversation starter and nice to use at Atari meetings. ;)

I really don't think so, as the problem is still there even if
newdesk.inf is deleted. I.e. even if this file doesn't exist at all,
TOS will crash when it tries to look for it. If I hold down control it
works fine, as newdesk.inf isn't read in this case.

> Your description makes it sound as if you are using the *same* NEWDESK
> file on all these machines, probably having copied it from the Falcon.

No, they're all created from scratch on the different machines. I can
delete the old file, boot without it, save the desktop and TOS still
crash when it tries to read it.

> files (but not quite), but TOS 4.04 has many differences, and so does
> the MultiTOS desktop. They should NEVER borrow files from each other.

MultiTOS can happily read my 3.06 and 4.04 (I haven't tried it on my
Mega yet) newdesk.inf files as long as I'm using AHDI... As soon as I
switch to HD-Driver MultiTOS will crash as soon as I try to use a menu
if it read newdesk.inf during the boot.

I think that the slow upload speed (the same as the previous version which peaked at 1024 cps) has been solved with V1.53B), at least I'm getting some encouraging results now. I still need to hit "reload" to get it to actually list the single file that exists in my other web page.

No, it means that you can use DVD-RAM drives (with a capacity of 2 x 2.5
GByte per medium) like any other removable media drive. HDDRIVER is not
a driver for DVD-ROM drives.

> What could be used to play them on our platform (if it is possible) ?

A DVD-ROM driver is required, similar to CD-ROM drives which require a
CD-ROM driver. But an Atari is too slow for playing DVD movie disks
anyway. And as far as I know the data on these disks are compressed and
you have to pay a lot of money to get information about the compressing
algorithm.

You can put any file system on a DVD-RAM drive, i. e. it must not be a
CD-compatible filesystem like ISO9660. You can use a DVD-RAM drive just
like any other removable media drive and put FAT filesystems on it.

Hey guys, I was wondering what's up with the Atari fido nets...

Atari
Atari_ST
ST_prog

I am trying to get some BBS's in Ft Worth and Dallas to start carrying them. I say them as fairly active on Doc's place BBS when I telneted to them, but when we tried to set them mup resently we have not not received any messages... can someone please tell me if they know what the current state of these message areas are?
Also.. all you sysops.. I would like to like to ask all of you to carry these Atari fido nets on your BBS and ask what would it take to have your BBS support it? I would just love to get us talking at the BBS level!!

Thanks,

Doctor Clu

PS: If you know of any other net work areas on a BBS that we could incorporate besides fido.. that have an Atari message area, I would love to know about. I know that Atari used to have a network of Atari BBS's out there.. anyway.. I would love to know more.

That explains it.

Because everybody complained that this excellent kernel didnt do very much,
MS borrowed a hack, which later became known as MSDOS. :-)

Aha, I was sure this must have happened to others beside myself,
but this is the first time I see it confirmed. I haven't been
reading this group very long, so I missed your earlier mention
of it.

>But guess what happened on Tuesday? Right, suddenly I was unable to
>boot my TT because - you guessed it - MagiC's boot-log was all over the

>the entire partition.

That did not happen to me, but I suppose it is a matter of giving MagiCs
bootlogger more 'rope'... Sooner or later it may use it to hang the FAT.

>Has anybody else experienced this? I was (didn't reinstall it) using
>6.01, with NVDI 4.12 and HD-Driver 6.30, the Falcon was running NVDI
>5.01 and HD-Driver 7.12 when it happened. MagiC has trashed partitions
>on my Falcon many times before, but it has never happened on my TT with
>previous versions.

My problems never got quite that serious, and were limited to a lot
of trashed files, whereafter I figured out that the boot log was
responsible and turned it off.

I suggest that you do install MagiC 6.01 again, but this time erase
some lines in MAGX.INF before you try booting MagiC.

The lines to erase are all in the section headed by "[boot]".
The line that must be erased starts with "log=".

Since the log will then be shown on screen, as for normal TOS, it is
meaningless to keep the lines starting with "tiles=" and "image=".
As for "cookies=" I prefer to handle such things with tried and
true \AUTO\ utilities.

The net result of all this is that my "[boot]" section is empty, so
the "[boot]" line is immediately followed by the "[vfat]" line.
All my MAGX.INF files have been fixed in this manner, and since I
did that I have never suffered any of these problems again.

>though...

Ok. I guess this means that some of the signals are not considered part
of the bus, and are therefore not disabled with the rest. Could be that
some hardware (Combel/Videl ?) is dependent on such a signal for some
reason. But it should be possible then to replace the CPU by some
simple 'straps'. But I don't recommend experimenting with this without
more definite facts available.

>Btw. a broken pin on the CPU is not fatal, Geir Vi¿½lidalo broke two (2)
>when he installed his AB and managed to fix it with one strand of wire
>from a piece of multistranded wire, a 15W soldering-iron and some
>super-glue.

Sure, it can be done. I've done similar things with other chips in an
emergency, but there is always a risk that it will fail too. If a pin
breaks *inside* the plastic (or worse, ceramic) Then it is necessary
to carve/drill/chamfer into the side or top of it, and that can harm
other pins or bonding wires inside.

I've updated the Atari Computing section of my site again. As I mentioned in a previous post, I put up a new archive of Jane Jetson's Strip Poker, and also BACKWARD to allow Falcon users (like myself) to play poker with Jane.

A few tips:

I know that hitting the space bar will make your cards/hand disappear so that you can get a better look at Jane. And for discarding cards - select the cards you want to get rid of with the left mouse button, and once selected, click the right mouse button.

Enjoy!

-Paul

Aha ! I think I have a clue now.

The control key does not only block reading of the NEWDESK.INF file, but
also prevents loading of the DESKICON.RSC file, so that only the built-in
icons are used.

I recommend testing with another 'known-to-be-safe' icon file, and remember,
it must be in the old resource format for TOS 2.06 and 3.06, as they have
no support for colour icons or the extended format that those demand.

The safest test of all is always available, just delete/rename DESKICON.RSC
to force the TOS to use built-in icons, regardless of the control key.

----- snip ----- re: my (mistaken) guess about same INF on all machines
>
>No, they're all created from scratch on the different machines. I can

Ok, that further confirms that it should not really be a problem in the
INF files then, adding some weight to the suspicions against the resource
files instead.

>> files (but not quite), but TOS 4.04 has many differences, and so does

>*if* it read newdesk.inf during the boot.

The fact that you can get away with it in some cases with some driver
does not mean that you can ever rely on it. But then again, one can't
really rely on MTOS under any circumstances, as its support was dropped
before debugging got anywhere near completion.

>It's strange, it's good in turbo mode on my falcon (I use always TOS 7.0x).
>Without this modification, your DSP works in turbo mode (you can remove
>hardware patch by only remove wire on FPU pin 31) ?

Sure, but I don't want to have any more external switches, and the long leads
that would require. Instead I leave the patch connected at all times, which
does not appear to have any negative effects, even for those cases when it
can not help a program work properly.

>I think to time-out or crashs...

I don't understand the sentence above. What does it refer to ?

>During CT2B tests, I have found a problem (only with my card ? I don't know...)
>For exemple CENTBNCH was locked, I have searched problem and I have found :
>My DSP clock was bad at 50 MHz (OK at 32 MHz in normal mode)

I don't think I have that problem, as that should affect also the many DSP
programs that do work fine for me, even in the turbo modes.

>so I have found
>a solution, now I use directy 50 MHz clock on oscillator (I have cut signal 11
>DSP clock). My DSP is always at 50 Mhz.

The funny thing is that I have seen Centek docs that clearly state that this
is how all CT2B do DSP & FPU clocks, even in compatibility mode. Evidently
this must be one more example of their problems with the english language,
as both FPU and DSP are clocked at the normal 32 MHz in compatibility mode.

I think they must have intended to put a word like the french 'pas' somewhere
in those descriptions, not realising that that particular kind of negation
does not exist in English.

>DSP interrupt is only used by Aniplayer and Quincy (maybe for demos or games...),

Also some MOD-players.

Hmmm, I don't have 'Quincy' (I don't even know what it is), but I do have
Aniplayer (unregistered), and guess what: It does work with my patch too,
in turbo modes, even though the other program I tested still produces 24
bombs (== spurious interrupt) in those modes.

This makes it appear as if there are different ways of using DSP interrupts,
and that the patch helps in all modes for some of them, but not for all.

I should add that the program I tested is rather critical, as the software
patch does not work at all for it, regardless of the CT2B boot mode used.
It only works with the hardware patch, and only in compatibility boot mode.

>this modification have same results in normal or turbo mode.

Maybe on your system, but not on mine. That is not surprising, when all
chips involved are driven high above their specified frequencies. Then
differencies between individual chips of the same type can be visible,
which are normally hidden when running them within their specifications.

>It's only for remove patch in Auto-folder.

Of course I disabled the DSPpatch program when testing the hardware patch.
Else I would never have seen the 'spurious interrupt' messages that came
when I tested in turbo modes. (With the software patch my test program
simply froze the system, without bombing.)

>>I believe this is because cumulative delay, from the time that the CPU sees
>>the IPLx signals until the XHACK and DSACK0 signals begin to respond, is
>>simply too long. This would require that the CT2B insert some waitstates
>>before generating the bus error that causes 'spurious interrupt' state.
>
>Delay isn't important because 68030 wait DSACK0 signal during 4-6 uS
>(watchdog delay on CT2).

In fact that was the kind of 'waiting' I was suggesting, and if such is
already used then it is obvious that some other factor must have prevented
the patch from helping the program I tested to work.

>>As it is I can't even get it to work when using 74F instead of 74LS, so
>
>I use a 74LS05 an inverted gate with open collector output (more important
>for CT2 !) In final stage 2 gates are in // for drop low level.

And I used the same kind of connection too, but with a faster IC with even
stronger output drivers, and it still did not help. But since it *does*
help Aniplayer, I think that some other problem must have been involved
with the other program.

Now for something I should have commented on earlier, as it does affect
all others who want to add this patch into their CT2B Falcons.

The expansion sockets as shown in MONTAGE2.IMG do not exist, either on a
Falcon or on a CT2B. Yet all the patch files refer to that 2x20 connector
and 2x40 connector, even though no connectors of those sizes exist. This
means that the suggested method of connecting the patch output to one of
the pins on that connector is not possible.

Instead it is necessary to find a 'through-hole' on the CT2B, connected to
both FPU pin 31 and CPU pin 3. One good position is between the 'innermost'
corners of the Flash ROM chip and the ispLSI1016 chip. There you can find

four adjacent holes in a line pointing towards the FPU in a 45 degree angle relative to the board edges. The one of those holes that is closest to the FPU is the one with the right signal. Make sure you have found the right hole by measuring 0 ohms resistance between it and FPU pin 31.

The hole is perfect for the kind of wire used with mini-wire-wrap tools, but such wire can not tolerate much bending back and forth, so it is best to make a fixed connection terminal for it on the CT2B, to which another wire type (multistranded and thicker) can be soldered, so that it can be removed for future work without straining the singlestranded wire, or having to desolder any wires at the patch IC (piggybacked on U44).

I located one of the few spaces on top of the CT2B that is free of signal traces, and placed a homemade connector there made from a scrap of resistor lead bent into a suitable shape, and fixed it to the board with a glue blob.

Now, Didier, I was much surprised at the time that you never mentioned any of these things, and the only explanation I can find for that is that your equipment is not really a CT2B, like mine. Possibly you have some older or even an experimental version. So which is it ?

>You can use my e-mail for resolve this problem if you want.

Perhaps some other time. I have other things I must first attend to. Also, I am not sure if it really is a problem :-) After all, we do get the same result with Aniplayer, so I strongly suspect that the program I was testing with will fail in turbo mode on all machines.

I can understand your irritation, but if you have never tried MagiC 6
without that silly bootlogger, then you simply haven't tried it for real.
With that function disabled MagiC 6 is more stable than older versions.

>Define "work right" ...

It should be possible to launch all program types ACC/APP/PRG/TOS/TTP/GTP
from the desktop, and they should then be launched in the way appropriate
to that program type. This does not work correctly, so very few programs
run at all under Thing+Geneva without MiNT. For some reason this changes
a lot if MiNT is also used, but not sufficiently to allow all programs to
work properly. But I can't describe those problems very clearly, as most
of my tests have been made without MiNT.

>Thing 1.27 should work with Geneva 006, and

I agree, it should, but for me it doesn't.

>besides, why should it need to recognise Geneva? If the OS is AES 4.x
>compliant and supports appl_getinfo() properly, there shouldn't be any
>need to specifically recognise it.

But there is, because MagiC, MTOS, and Geneva all use slighty different
argument rules for shel_write, and have different Pexec modes too. This
means that program launchers, and especially a desktop, must adapt to
these differencies. These are AFAIK not covered by appl_getinfo, so
that function doesn't seem to help for this.

Some of my 'test memories' may be from tests with older Geneva versions,
but most of the things I've mentioned have been verified with Thing 1.27
and Geneva 006.

If you still doubt that Thing has problems with Geneva, just try starting
Geneva without MiNT, and with Thing linked as desktop, and then try to
launch EVEREST.PRG, and various other APPs. That should make the problems
clearly visible. (I can't launch *any* APPs properly in such a setup.)

Unfortunately this does not match my experience. You may be right about
some of the changes, but several serious problems obviously remain.

I have tried using Geneva 006 with Thing on all my machines, and have not
succeeded on any of them. The total accumulated time I have spent on such
experiments is in the range of some hundred hours, so all obvious methods
have been tried, such as trying 'nearly clean' boots, and all kinds of
experiments with the GEM.CNF settings. But nothing seems to help.

When booted by MiNT, Geneva does appear to modify its older methods enough
to let Thing lanuch most programs, but there are still some 'odd' effects.
It is not this mode I want anyway, as I dislike MiNT's immense slowdown of
the system. Even a TT feels unpleasantly slow when running MiNT.

When Geneva is booted without MiNT, Thing consistently fails to launch all
normal program types (TOS/TTP/APP/PRG/GTP), though it does succed with ACCs.

Actually the other programs do start up too, but as soon as they start to
use GEM functions they get error returns and then they either bomb or abort
cleanly. This even happens to TOS/TTP programs since GNVA_TOS also suffers
from this effect.

Nothing like this happens with other desktops, such as Gemini or Teradesk,
that both work quite well with Geneva, though they are limited in their
usefulness since they lack many modern improvements (which Thing has).

I don't mind, as this is a newsgroup after all, not private mail.

>From what I read in the HSMODEM7 DOCs, SCC.PRG should be used in place
>of MFP.PRG due to high speed transmission drops with MFP on the Falcon
>and use MFP.PRG only if Modem 1 was physically brought out.

It is true that you can't use the 'Modem 1' driver of MFP_FALC.PRG without making a hardware patch to get the serial line out, and converted to RS232, and even then (just as you say) it is not useful for high speeds as it has no handshaking, and the system won't allow more than 19200 for it anyway. So it is not a port many will want to use much. (I don't use it myself.)

But that was not the reason I suggested that MFP_FALC.PRG should be included. Instead that was only to assure that as many ports as possible will use the same Bconmap slots as they would on older machines. The reason for that is that many programs (including Connect) use a Bconmap index, and nothing more, to specify which ports to use. They assume that the relation between slot index and port driver name will always remain what they were when saving the settings, so they only save the indexes in the setting files, whereas they should save the names, and determine indexes at each startup.

And some programs even assume that a certain index must always stand for a given port, usually in the index order matching my recommended order for the HSModem modules.

When such programs are used with HSModem modules in some other order than that which produces the index order they expect, they will access the wrong ports. And that can mess things up for STinG and other clean programs, by causing the ports they need to be locked away.

>But I've been wrong before!

The things you said were not wrong, but didn't releate to my point either.

If you have access to an Amiga (any model) I'd suggest you use the inbuilt speech features of the OS/hardware. I believe Das Boot used speech created on a stock Amiga and C64 with a speech cartridge (MagicVoice?).

Just a suggestion...

Excuse me for intruding (if I am). From what I read in the HSMODEM7 DOCs,
SCC.PRG should be used in place of MFP.PRG due to high speed transmission
drops with MFP on the Falcon and use MFP.PRG only if Modem 1 was
physically brought out. But I've been wrong before!

3655. SV: Battery Case on the Mega ST2

Newsgroup: comp.sys.atari.st
Date: 1999-05-29 00:00:00 UTC
From: Martin Graiter <graiter@starmail.com>
Message-ID: <7inr1c$j3o$2@zingo.tninet.se>
Source record: 77967

It seems that TOS 1.4 was the first to support the graphic card used in the Mega ST together with the SM194 monitor.

A way to see if your computer contains (at least) the 1.4 is to press CTRL+ALT+Delete and see if a reset occurs. If it does not, your TOS is a 1.0 or 1.2. To see if your TOS is (at least) a 1.2 you can display a text in the built in VT52 emulator, the shower of any text file from the Desktop. Your text should contain some characters that are more than just the UK or US alphabet, like the swedish ������. If they're displayed your TOS is greater than 1.0.

Just wonder why Atari Corp. never displayed the TOS version information in the Desktop? Instead there are copyright notices and credits to Digital Research.

> though...

With a CT2 installed the motherboard's CPU can be removed without problems. It must be noted that this removal affair is a VERY delicate job! Even when you cut or saw away the pins it is easy to use exessive force, thus possibly damaging the underlying tracks on the motherboard. The best way to do this is with a special hot-air desoldering tool. It is also the fastest way, takes just a second.

A Falcon that was sent to Centek came back with the original CPU missing, the remaining pads were clean and neat. Don't know if Centek normally desolders the onboard CPU when installing the CT2 themselves, or if this particular Falcon was a "problematic" one?

The CT2 is quite impressive in performance, but the Centek people seem to be an extremly rude and uncivilized bunch. Abusive letters and references to the "crystal clear" manual made me both want to cry and laugh. The installation manual is anything but clear. Maybe the manual is crystal clear for native English speaking people?

If you want to keep the original Falcon casing you better get a Dremel hobby tool. The metal shielding needs to be modified extensively. There is a capacitor and a 50MHz quartz crystal that both protrude upwards which requires extra holemaking in the metal shielding above them. This I believe could have been realized in a sleeker way. There are very small surface mounted capacitors and quartz crystals as well. Maybe even these components could have been mounted upside down? Also the CPU fan seems oversized, there are small, 1" fans available, but the use of a bigger fan might have to do with the capacity for air circulation? This big fan requires the internal HD to be pushed away towards the edge of the Falcon (to the "north") and thereby requireing more metalwork in the shielding.

Maybe some kind of sandwich construction would have solved some of these inconveniences, and water cooling as well? (joke!) Maybe all Falcons should be sent to Centek so that they can remove the CPU and solder the CT2 into those free pads instead? Would leave the expansion slot free for a graphic card instead.

Despite the criticism I consider the CT2 to be a remarkable speed-up board which makes "heavy" applications like Ghostscript or Calamus work in a much

more pleasant way.

A decent graphic card and an ethernet connection is next on the wish list.

> I have an 810Mb 2.5" drive I could use in my STf...??

there is a board you can use for the STE, which I know isn't much use to you, but for anyone else that is interested.
The Upgrade Shop (England) do an internal IDE interface for the STE, this can bu put on top of their Veloce 020 Upgrade for the STE, so you could have a 16Mhz (With the option of 4 meg extra RAM) 020 processor, TOS 2 (Comes with the Veloce board) and the IDE interface all in one ugd. And all without having to fit a new case to the STE :)

I know it isn't much use to you, but for other people that might want to upgrade their STE's.

Hej Ronald,

actually, since the latest Okami version I installed Tos2gem in my MagiC Start folder. Now I don't have to hit "any" key upon completion of Maintain, Import or Export ops. The window however only closes at quitting Okami or if you hit the closer manually. It works OK but definitely slows down Okami.

Always wondered why these ttp's didn't run in VT52, which is standard installed by MagiC.

I'm just wondering, will the stuff run in Toswin2 (what I use running Mint) or allows Okami only the use of Tos2gem?

Next Q, and more directed to Jos: why can't the ttp's make use of VT52? Perhaps some changes in the coding would allow that.

From: ad329@james.hwcn.org
Message-ID: <7ins5k$jp5@james.hwcn.org>
Source record: 77974

Awwww crap!!!!

I need to convert some PC graphics files for use on my Atari ST computer.
I used to have a really old really version of Paint Shop Pro that supported
Degas file formats but wouldn't you know it, the newer version seems to
have dropped that support. I hate when things like that happen.

I've got programs for the ST itself that will do such conversions, but
they do it much slower than I can do it on my PC with a Hard Drive.

Does anyone know of a program for the PC that will save image files as
Degas .PC1 type files (and is that the old degas format or is it Degas
Elite?)

Any help will be appreciated.

I haven't followed the thread so I don't know what you exactly means but
as a stand alone application the various ttp's runs fine with Toswin2 in
VT52 mode. Launched from Okami however these ttp's doesn't call Toswin2
(at least not on my Hades) so you'll get an ugly white screen.
I've used for a while Toswin2 and Tos2gem together but this maked the
system rather instable so I'm back to Toswin2 only.
I avoid to use these ttp's from inside Okami.

The card made by Mario Becroft works in STF and MEGA as well.
It is also a good excuse to install TOS 2.06 (required to
access the drive) and upgrade your STF to its full 4 MB of RAM.

I do not have the URL to Mario's site off-hand, but typing
"mario becroft" in Yahoo should give you the answer.

Hello fellow Atarians,

In order to clean up my room a bit, and to give other people a chance to
be happy with stuff that I never use anymore ;^) I'll have the following
for sale. Make an reasonable offer and the it's yours..

Software:

Serious:
Calamus SL (Dutch manual) + Calamus printerdriver for Epson Stylus Colour
Inshape Intro 1 = 3D modeler & shader (Falcon only)

Games:
Killing Impact (Falcon only)
Epic (platinum edition)
Zero-5 (Falcon and STE only)
Running (Falcon only)
Robinson's Requiem (cd-rom) (Falcon)

Music:
MusicoM 2 = Harddisk recorder/ sampler program (Falcon only)
Concerto = midi sequencer, able to play samples all
The Mix Machine = digital recording and editing of samples (ST(E))

CD-Rom:
NCS cd-rom with Falcon demo's
Compo STE Power CD vol.1
Lohrun public domain and shareware CD vol.3

Hardware:
Atari-Falcon 4Mb ram card
Falcon keyboard
2x Atari Powerpads
Roland SC33 Soundcanvas midimodule (perfect for playing midi/sequencer files)

Groet,
Karsten

3668. Grandad's Quest 1 code needed

Newsgroup: comp.sys.atari.st
Date: 1999-05-29 00:00:00 UTC
From: Satcom2 <svenhard@primenet.com>
Message-ID: <7iol1jfmq1@nnrp02.primenet.com>
Source record: 77980

I registered long ago for the 2 games, Grandad's Quest 1 and also Grandad's Quest 2. The second one came with a code sheet on dark red paper, which I still have. The first game simply had one code, the same for everyone. I lost the paper I had it written down on. I had the code backed up on a floppy, but I can't find it anywhere.

If someone could e-mail me the code that would be cool. I already payed Ian Scott (the Author) for it.

If nothing else and nobody trusts me, can anyone tell me where I could contact Ian Scott so that he could personally help me out? Thanks. -Satcom2

3669. Keith's www.radix.net/~atari/ gone??

This is the URL of whoever bought Toad's overstock, but it seems
gone. The guy was obviously called Keith, but no other info remains.

I am trying to locate him, to buy soe of his MEGA-STE motherboards.

3672. STE 2.5 Meg upgrade program - do you want it?

Newsgroup: comp.sys.atari.st
Date: 1999-05-29 00:00:00 UTC
From: Caroline Hawker <cornelii@clara.co.uk>
Message-ID: <01bea9e8$1609cb40$LocalHost@default>
Source record: 77984

"Do you want it? Do you sir, do you? Well you can't have it sir - it's mine. We're closed."

Hi, everyone,
Years ago, when I used my Atari ST (my brother has it now) I upgraded it to 2.5 Megs, and it didn't work, because the OS didn't recognise that memory configuration. So I wrote a little proggie in assembly that sorted the problem out. I tried to put it about on the internet a few years ago, but the place I tried to upload it to didn't seem to work. Any way, if people think they would find it useful I will upload it and put it about. I know that there are other utilities around, but they probably do not have all the same features as mine did.
So what's so special about my one? Well, this is a run down of it's features:
- it's under 512 bytes , less than 1 sector for maximum speed in loading
- written in machine code, runs virtually instantly
- simple installation - just put in an auto folder
- transparent operation (works without any user input)
- hotkey gives you a menu
- menu lets you adjust memory size to all possible variations (for compatibility if needed)
- menu lets you run games with ease - it pauses to let you put in a games disk
- it's free
I never had any problems at all with it. It works fine, though I expect there may be some other programs that do exactly the same. If you have any gripes about other programs, though, this would solve them. If anyone wants the source code they can have it, too. Just reply to the newsgroup to tell me if it's wanted at all, because I will have to get the disk from my parents house. How do the other programs that do this compare?

--
Graham Cornelius or Caroline Hawker (depending on who's using this rust bucket)

If this is about cross stitch, it's Caroline
If this is about computers/hifi it's Graham

e-mail : cornelii@clara.co.uk

Windows works just fine - it was designed to crash every 15 minutes

3673. Re: Speech engines

Newsgroup: comp.sys.atari.st
Date: 1999-05-29 00:00:00 UTC
From: Oliver_Schildmann@LU.maus.de

Source record: 77985

Hello "Clockmeister",

g> If you have access to an Amiga (any model) I'd suggest you use the
inbuilt
g> speech features of the OS/hardware. I believe Das Boot used speech
created
g> on a stock Amiga and C64 with a speech cartridge (MagicVoice?).
g>
g> Just a suggestion...
The speech of "Das Boot" sounds exactly like SAM ("Software Automatic
Mouth"), a speech processing software which exists on C64 and Atari
400/XL.
later on, this sofware was the basic of the speech software of the Amiga
(still sounds identically).

Due to the facts that there is a version for Atari ST too (also sounds
identically -> ST Speech) and that most (if not nearly all) of the techno

music at that time was made with Ataris, the speech of "Das Boot" should
be
also made with an Atari. ;-)

Greetings, Oliver

I have had a problem with the SCSI on the Hades. Medusa Computer Systems suggested that I try active termination rather than the usual passive termination. You can buy active terminators but to be honest I bought one today and tried it this evening and it did not help.

I put up a new archive of the Jane Jetson's Strip Poker game on my web site, as I noticed there were a couple of errors when un-zipping the original archived file. So if you had any trouble with it, grab the new archive. It's available on Nurmix Web Central:

http://www.tsotech.com/nurmix/home.htm

Just click on the "ATARI" computer link to get to it.

-Paul

BTW: More ST/Falcon/8-bit games and other cool stuff will be available soon there. Check it out from time to time! :^)

You could use Image copy, but it costs 20 odd quid, and you don't spound like you need it that much, try the ultimate TOS download site or something like that for a proggie, there will be one out there somewhere. The atari copmputing page has a link to it (I can't remember the URL for the page) got to the atari computing page at: www.ataricomputing.com, and try their link pages..

> anyway. And as far as I know the data on these disks are compressed and
> you have to pay a lot of money to get information about the compressing
> algorithm.

True the compression algorithm is not likely to be a commonly known
piece of information, but some DVD-ROM drives have a composite or a
S-video plug on the back meaning that the video signal could be put
to where it belongs...on a bigscreen telly...computer monitors are
too expensive and too small for that kind of application I believe.

Also the quality of playback I have observed on even P3 machines is
dreadful, and quite frankly pales next to the quality from a dedicated
DVD Video player.

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

There's a lot of MiNT-only stuff I've gotten used to as well, so I can't
imagine ever switching over to MagiC on my Falcon anyway. I only use for
testing, it should suffice to run it on my TT for that.

I understand the conflict stems from the method Thing and Geneva use to
restrict memory for older, RAM-hogging applications.

(As I recall, if no memory limit is necessary [i.e. if it is a modern program],
Thing instructs Geneva to reserve 0K for the program.)

I believe there is a patch available for Thing to bypass this feature.

Earlier Geneva versions got slowed down when runned with Mint. With
Geneva 6 the difference in speed with or without Mint is almost gone.
Perfectly usable even on a 8 MHz ST.

OK, so I could get a board for a 2.5" HDD but I am getting a spare
3.5" Ultra Wide SCSI too soon (free) about 9Gb. It is a WD drive, any
way this can be accommodated inside my existing STf ??

Cheers

Hehe! <G>

Indeed, that was the well intentioned theory. As we both know, it was
sadly let down due to complications concerning the byte and word
ordering of the cpu(*). A bug in its internal logic lead to the NOP
having a side effect of jumping to another memory location. This
quickly spread "viruslike" and soon MSDOS was born.

(*) Known as GIT - Giggling Intel Technicians. They tried to organise
a piss-up in a brewery but somehow ended up back at the factory and
mucked up all the connections on the processor blueprints. The parties
involved maintain they were playing twister, although the security man
who walked in on them still insists they should all have been
arrested.

You could have at least taken out my comments in the st.gif used on this page. Load it into a text editor and look at the header :-^

Ironically it took me longer to figure out how to add comments to gifs using qed in binary mode than it did to do the actual graphic (scanned from an old CompuServe advertisement).

If you're intent on using the graphic, I'll create a version that blends in with your page's specific background color.

Yes, thatï¿½s exactly the same was other german buyes says. The all got
"B" accelerators. Looks like "rich an nosy!" :/

> Maybe the manual is crystal clear
> for native English speaking people?

What? :->

I got my Rev "A" november last year, after that i create a HTML manual
with picture in three languages. I send this in more as one time to
centec, but they returned not ONE answer that they use it or kick it.
Also i canï¿½t put it to my homepage without an answer from centek.

Have fun it your CT2 works, forget the rest.
Nobody intressed.

> If you want to keep the original Falcon casing you better get a Dremel hobby
> tool. The metal shielding needs to be modified extensively. There is a

Yes, but use also an vaccuum cleaner at the same time. :-)
Dremel kicks metal particles..
Hot air, best way.

Yes, thatï¿½s also a joke, saw SOME CT2 here with a -taped- Fan.
They use double sided tape to fit the cooler block on cpu top..

I donï¿½t know what that means.
Any kid knows that he have to fit cooler blocks with special clue.
(Clamps doasnï¿½t work for this kind of cpu)

No comment..

> Maybe some kind of sandwich construction would have solved some of these

3700. atari stuff for trade

Newsgroup: comp.sys.atari.st
Date: 1999-05-30 00:00:00 UTC
From: ethh@enemy.org
Message-ID: <7irked$1m4$1@news1.skynet.be>
Source record: 77923

i'm willing to trade atari stuff for atari stuff.

at the end of the list, there is some other non-atari stuff to swap as well
but i'm only interested in atari stuff, don't propose other stuff or money.
meanwhile, i'm ready to buy lynx games and equipment.

i'm in belgium so consider the postal costs accordingly.

tags: games title have tags. these are: "b" to say it comes with the box; "d"
to say it comes with the doc; "f" to say it has no value to me and that it is
free to give away along with any other swap.

bargain by e-mail only.
===
i propose:

lynx games: ishido (bd).

jag games: kasumi ninja (bd), myst cd full version (bd).

vcs2600/7800 games: amidar, sorcerer's apprentice, adventure, yar's revenge,
jungle hunt, centipede, tennis (d), karateka, pac-man, moonsweeper, air sea
battle, maze craze.

a ttm195 cable.

n64 games: turok2 seeds of evil (bd), doom64 (bd).

===
i'm looking for:

a tt-ram card fully fonctionnal that can carry at least 8mb, andor 4mb 30pins
60/70ns simms.

any lynx games, particularly: slime world, ms pacman, asteroids/missile
command, warbirds.

any jag games, particularly: worms, syndicate.

any vcs2600/7800 games, particularly: sky diver, reactor, tic tac toe,
dig dug, enduro.

any st originals, particularly: starglider ii, superwonderboy in wonderland,
ghost and goblins, ghouls & ghosts, elite, castle master 1&2, viking child,
tower of babel.

mouses and 9-pins joysticks for atari.

in order to burn them and put the pictures on the destroy microsoft website,
free original microsoft products of high value with box and docs (you won't
ask for something in exchange for those).
===

Sorry my english is very bad...
My question was 'Do you have problems with DSP in turbo mode ?'
Because when DSP delay is removed on set-up all programs used on my computer
works.

>>During CT2B tests, I have found a problem (only with my card ? I don't know...)
>>For exemple CENTBNCH was locked, I have searched problem and I have found :

>this must be one more example of their problems with the english language,
>as both FPU and DSP are clocked at the normal 32 MHz in compatibility mode.

I don't know if DSP and FPU have always same clock (32 in normal /50 in turbo),
because I don't remember to found 0 ohms resistance between FPU clock and CT2B
connector pin 11.

>I think they must have intended to put a word like the french 'pas' somewhere
>in those descriptions, not realising that that particular kind of negation
>does not exist in English.

It's easy to speak in english, but explanations are another story...

>bombs (== spurious interrupt) in those modes.

What is your others programs who use this interrupt ?

>This makes it appear as if there are different ways of using DSP interrupts,

Why ? Another possibility is only in DMA, but this function not exists on a
Falcon. If you have 'Motorola DSP56000/1 Digital Signal Processor User's Manual'
look inside.

>and that the patch helps in all modes for some of them, but not for all.
>
>I should add that the program I tested is rather critical, as the software
>patch does not work at all for it, regardless of the CT2B boot mode used.

That's right. Centek think to put this patch in Dolmen !

>It only works with the hardware patch, and only in compatibility boot mode.
>
>>It's only for remove patch in Auto-folder.
>
>Of course I disabled the DSPpatch program when testing the hardware patch.
>Else I would never have seen the 'spurious interrupt' messages that came
>when I tested in turbo modes. (With the software patch my test program
>simply froze the system, without bombing.)

Your system is frozen, I had this problem when I used only one gate in final
stage (in normal and turbo mode). Maybe low level is bad, do you have a scope ?

>>I use a 74LS05 an inverted gate with open collector output (more important
>>for CT2 !) In final stage 2 gates are in // for drop low level.

>Now for something I should have commented on earlier, as it does affect
>all others who want to add this patch into their CT2B Falcons.

I have made an article for a french magazine ACC, 6 pages in french...
sorry ! It's already very difficult for me to create a documentation in
english in Aniplayer.

>The expansion sockets as shown in MONTAGE2.IMG do not exist, either on a

It's only for CT2A, you must use FPU connector on CT2B. I have put a pin,
between PLLCC and FPU. I know it's a little doc...

>Falcon or on a CT2B. Yet all the patch files refer to that 2x20 connector
>and 2x40 connector, even though no connectors of those sizes exist. This

It's for CT2A, look MONTAGE.IMG !

>means that the suggested method of connecting the patch output to one of
>the pins on that connector is not possible.
>
>Instead it is necessary to find a 'through-hole' on the CT2B, connected to
>both FPU pin 31 and CPU pin 3. One good position is between the 'innermost'
>corners of the Flash ROM chip and the ispLSI1016 chip. There you can find

Humm, you lost guarantee if Centek found a solder on your card...

>four adjacent holes in a line pointing towards the FPU in a 45 degree angle
>relative to the board edges. The one of those holes that is closest to the
>FPU is the one with the right signal. Make sure you have found the right
>hole by measuring 0 ohms resistance between it and FPU pin 31.

DSACK0 and DSACK1 are directly connected between 68030 and 68882.

>Now, Didier, I was much surprised at the time that you never mentioned any
>of these things, and the only explanation I can find for that is that your
>equipment is not really a CT2B, like mine. Possibly you have some older
>or even an experimental version. So which is it ?

It's the same card, I'am sure. About experimental version, Centek has sold
a CT2A ;-))

3702. Installing a Megafile 60

Newsgroup: comp.sys.atari.st
Date: 1999-05-30 00:00:00 UTC
From: h.bruening@pop.online.de
Message-ID: <7irr35$q1c@news.kdt.de>
Source record: 77925

Recently I got a 1040STf with a Megafile 60. But I have problems of installing the Harddisk. Simply loading of ADHI.PRG stoped with a "identification unavailable" Error. I read in www.deja.com that I should reformat the HD. After I have done this with HDX.PRG I neither was able to use the HD. Sooner I read, that anyone had this problem after updating his ADHI.PRG from version 3 to version 5. So I searched the older version of ADHI.PRG. After about two hours of searching I didn't find the older version.
Now the question: Does anyone know an answer to my problem? Does anyone know where I can find older ADHI.PRGs?

And a second question: Which plug-in of the Harddisk should I use? If I plug the cable from the ST into HD-OUT I am not able to use the Ploppy Drive.

Sorry for my possible bad English :-(

So it's not just me? A relief in one way, but worrying from the perspective
of how the company treats its customers. Nous sommes pas chiens.

> > Maybe the manual is crystal clear
> > for native English speaking people?
>
> What? :->

The question was slightly rhetoric, but maybe it's so that we who have
learnt English in school lack grasp of the language in some of its many
fields? Like Centekian English...

> Also i can't put it to my homepage without an answer from centek.

Why can't you? Just do it. If they don't like it they will get in touch with
you...
...and call you a \#%$&!!!

> Yes, but use also an vaccuum cleaner at the same time. :-)
> Dremel kicks metal particles..

You are so right! Everything gets dirty from the metal dust.

> Good idea, but i think that doasn't work without an special socked.
> To expensiv.

"Too expensive" was surely the eternal motto when the Tramiels produced the
ST series. The one-cent-question is: How cheap can you get?

> Ethernet sound fine, but how create the board ? ;-)

No need for that, you can buy a PCI card for next to nothing nowadays. The
hardware adaption to the Atari shouldn't be a difficult job. But the driver
software and the physical space for the card could be a problem. However, if
a professional company choose to make a custom card it wouldn't have to be
any bigger than a matchbox.

Or maybe someone will emulate an ethernet port with the DSP?
The emulated modem never came, exept for on MacIntosh, maybe we'll live to
see the emulated ethernet? Wonders can happen.

Yo! DSP programmers! Here's an idea for you!

Not easily, you're going to need aa very modern ASCSI interface like the Link97, really good software like HD-Driver, and it will need to be externally cased., it won't go inside the STf unless you modify stuff like crazy in there......Get a SCSI-box and put it in, you'll also need a 50pin to 68-pin converter, but it should work OK.....BTW you'll also need a better OS than Tos 1.x or else you won't be able to address all the drive anyway as you'll run out of adressable sectors (I think)...

Hallo,

Even een reply in het Nederlands vermits dit toch een Belg
is die antwoord.

Ik heb nog wat Atari-hardware staan die ik niet meer gebruik.

Eigenlijk staat het "stortklaar", terwijl alles nog operationeel is :

Mega ST4 (met 16 Mhz processor en PC Speed), Megafile 60,
monitoren etc.

Interesse ?

Does anyone know how printer drivers are compiled for pagestream
in order to get the Laserjet 600 dpis driver to work with new
printers they need new pcl commands to be written into them.
If anyone know how this is done please email me.

the computers do not want to print legal correctly at 600 dpi and
legal seperation.

Dungeon Master Nexus -- Information wanted

Any Dumgeon Master fans here? I have a Saturn, and was in Japan last week, and saw they have a game called "Dungeon Master Nexus". I did not want to spend a lot of money on a Japanese game, and was wondering if there was an English version of this game for any system? Also, as far as I know, Chaos Strikes Back only made it to the Amiga and the ST.....is this corect? They are reselling Dungeon Master in every flavour it seems. I recently played it on the Super Nintendo, but it is the same old ST game....Chaos Strikes Back would be cool to play again, but I sold it a while back. I am aware of Dungeon Master II for the PC, but that is an annoying game. The theives and flying orbs really tick me off.

Anyhow, forgive the Non ST question, but I know that a lot of Atari ST fans liked this game, and perhaps can answer my questions.

Hei!
Can anyone tell me which software I can use to upload files to my
hompage?
It should be some kind of FTP-programm, shouldn't it? In CAB-FTP that
works fine to download from FTP-sites I can't find an upload function.

I get connected with STiNG.

Thanx for help.

Greetings from Norway,
Thomas.

Yes - we're all talking about you behind your back and quickly disappear
as soon as you join. ;-)

Seriously, most activity in the ircnet #atari is in the evening, usually
the earlier CET hours (19-22) and if enough Americans and Australians
are there, it has another peak later in the night (CET). During daytime,
#atariscne is often more active than #atari.

There are currently 2 interfaces that allow this. The Upgrade Shop's one is STE only. Mario Becroft's one is for both STE and STF, and is sold in the UK by Chris Crosskey.

Both of these require TOS 2.06 if you want to boot from the HD, otherwise you'll have to boot AHDI from a floppy and then you'll be able to access your HD.

Thanks for the info.
I have now installed this patch on my TT, and can verify that it works.

>Having not read the documentation for Geneva-specific programming, I shant
>speculate as to what constitutes a "bug" and what may simply be a faulty
>assumption.

I have a feeling that both sides refer to 'standards' that have very little
to do with what Atari defined, but be that as it may. Life has to go on
after Atari Corp anyway.

>It's sufficient to say that I did perform the patch on a demo copy
>of Thing 1.27 here and the fix worked as advertised.

Yes, it works here too.

3721. CAB OVL's on Lycos searchengine

Newsgroup: comp.sys.atari.st
Date: 1999-05-31 00:00:00 UTC
From: louis@holleman.demon.nl
Message-ID: <375264fc6d7600e0@holleman.demon.nl>
Source record: 77852

Hi,

recently I experienced some trouble on the Lycos searchengine...

I know I used this some time ago without troubles, but yesterday I tried
http://www.lycos.com (the international one) again and at the end of
fetching/loading the mainpage CAB 2.5 crashes.

This was using Dan's 1.3016B, so I tried it with 1.3001, same shit.
Next I ran from 1.2805 and it doesn't crash...

I think the last time I used Lycos without problems I ran 1.2904...

This is on my TT, MagiC 5.01, NVDI 4.12 etc.

Anyone else with similar experiences? Note that using www.lycos.nl (the
Benelux search engine) has no probs.

BTW, a good thing I kept the old OVL's!

Source record: 77854

I have been investigating this, but haven't been successful yet.
Here's what I have learned:

Tom Hunt has written a program called PC Gateway. You run this on
a PC and connect to your ISP. Your Atari is connected to the PC by a null
modem cable. Tom has an 8-bit Atari BBS running BBS Express which can be
accessed by telnet this way. He says connecting an ST BBS in the same way
should be no problem.

Now for the "hard" part! As I understand it, you need to have a
"static" IP address and your ISP has to allow you to have Telnet access.
Most ISP's use dynamic addressing which means you have a different
address each time you connect. Thus, callers would not know what address
to telnet to. I have asked Tom to clarify this, but I haven't received a
reply yet.

Hi

Yes TOS 1.2 (or 1.02) will run in Hi-res, the problem you have sounds
like you don't have a Ni-res/mono monitor!

Using a colour one you can only access low and med resolutions. However
using a program, such as Sebra and other mono emulators, will allow you
to run most hi-res/mono programs although the picture quality is no
where as good as the real thing.

Message-ID: <7iu65g$fr4$1@nnrp1.deja.com>
Source record: 77856

On the dynamic ip address problem.. here are a few solutions.. "Static"
name services.. They will give you a name like "atari.dyn.ez-ip.net"
or "tazbbs.dynip.com" to use. They all have clients for the pc that
will do it automatically, it will tell the server what your IP address
is and anyone that request the name will be given your current IP
address if you are online. I always have a web server running on my pc
when I'm online.. at http://tazbbs.dynip.com

The services are.. www.dynip.com
www.dyndns.com (both around $25 U.S./year)
www.ez-ip.com (FREE AND WORKS WITH CAB!!)

the last one... ez-ip you can use Cab to log on manually. Then run
WebLight or the IRCD server(that's what I do)!! And sorry.. I already
have the atari address. <g>

You need the correct mono monitor (which provides the 'mono-present' signal
to the ST) to be able to do this. Look for a second user SM124/125 if you
are keen.

You use Newsie and this can upload files by ftp. If you want something a bit
more specialist then look for recent versions of aFTP by Atack.

Or bid on mine. Also in great shape with original packaging. Currently at
$9.99 + shipping.

I have been using the FTP part of NEWSie to upload jpgs to my web space. When I first logon,get the DIR list and do an upload, this all goes just find, then after the file has been uploaded newsie displays the message 'sending request' and sits there waiting for whatever until the coming of the next ice age. After 15 mins I hit reset to get out. and as I can't use cab 2.7 because I get that Can't Find RSC message, I can't use it for FTPing.

If you can do a followup you can do a new post. You need the
newsgroup name (comp.sys.atari.st) in the top box, subject and
author as required), then simply select Edit. When you have finished
writing your post in your text editor, select Save then Quit then,
if online, select Send. If not, select Queue and the next time you
are online and start NEWSie the post will be sent automatically.

|This is probably a stupid question but does TOS 1.2 run in high res?.
| . . . .

TOS will run in high res if you have a high res monitor. Atari had their own monitors (SM124 and 125 I think) but now you can buy others modified to behave as an Atari monitor or buy an adaptor for a VGA monitor. The output is high quality black and white at 640 by 400 pixels. This was excellent for its time and still is perfectly adequate.

You will not be able to get high res on a TV or colour monitor. There is a pin connection in the high res plug which signals to the computer when to use high res. It is there to prevent damage to monitors that couldn't handle the high frequencies used.

When using "standard" GEM programs like Okami, Qed, etc. I really do
not feel any significant speed difference. But I just tried a program
that does a lot of calculations and window draws in the main evnt_multi-
loop with evnt_timer active and set to zero. The same calculations took
almost exactly twice as much time to complete with Mint running.

>Also, for systems with little RAM, Geneva without MiNT is the 'cheapest'
>(in terms of RAM cost) way of getting any multitasking APPs to work, and
>many of them do work very well, even with a singletasking GEMDOS.

My computers only have 4 MB each and with 2 MB left for "user programs"
when Geneva, NVDI, Neodesk, STinG, etc. are running. This mostly works
good enough for my needs.

By using more than one computer I also get true multitasking :-) Been
experimenting with Bnet and it seems to work even without Magic. There
where some bombs when under heavy load but I have not isolated what
caused them.

>But the usefulness of all this is lowered drastically if one can't also
>use the same desktop as usual, which for me means Thing.

I am still using Neodesk as it does what I want in a very stable way.
And, I do run Win-95 (on original install since -96!) too, so maybe
that's the reason I still find Neodesk to be a very usable desktop.

Dennis,

same happens here, and also with aFTP. After the file's been sent, it
waits for the new dir to display and hangs forever. Simply quit, start
again and do the next file. You'll find the first file in the dir then
too...

Just once (O-N-C-E) I had Newsie displaying the updated list a few secs
after the transfer.

I always considered it an ISP problem (ftp-ing to my own pages), but
perhaps we need a Windows-compatible ftp-program??? :-)

IOL (output current for low level) of 74xx38 is better than 74xx05, so 2nd
gate on final stage is normmaly useless.

I've heard that Apple was involved somehow, though, I don't really see
that they could have all that much to contribute to a processor
architecture compared to the other two.
Anyway, the PPC is based on IBM's Power, with the 88k bus from Motorola,
IIRC. Doubtless Motorola made other contributions as well.

>Again, that sounds fine, but I can't help thinking that some fairly large

Uhm, if you run Atari programs under MagiCMac on that machine, there's
nothing that is especially PPC optimized involved (as long as you don't
try any IO, of course).

>It'll be interesting to see some NemBench files for the Tempest when it is
>finished, so we can compare it to other accelerators in a meaningful way.

Nembench results for Apple's emulator on a similar processor have been
posted here.

>than the P3.

I don't know what you're tying to say here.

There is no way a PPC750/400 is going to be twice as fast as a
PII/450 on integer code in general (though it might on some
specific benchmark, of course (that's why Apple keeps using ByteMark)).
For some floating point code it might, though, since the Pentium
processors are really bad at that (compared to other modern
processors).

The PIII is mostly the same as the PII, except for the addition of
the SSE (multimedia extension) stuff. Actually, the external cache
is supposed to have longer latency according to an article I read
a couple of days ago, so it's even slower on some code than an
equivalently clocked PII.

>Well, suggested release is third quarter and, afaik, the

There is a long time until the third quarter runs out...

>themselves. Second, the PPc chip being used is a 603 which
>has been around for a while and the chips and support

It's actually not a 603 that is being used in the Tempest.
If you look at the Motorola page Core refers to, it's the
MPC8240, a new microcontroller chip based on the PPC603 core.

>Well, based on the Apple and Amiga emmulation figures, Core
>design hoped for an emmulation speed of around the same as a
>80Mhz 68030. This, along with the much faster memory access

According to the numbers posted here, that sounds extremely slow.

>being enhanced in two directions. First, it is hoped that
>the emmulation system can automatically switch on and off
>per application allowing natice PPc code to run on the

This is of course really simple to do. A (not necessarily) free
AES and VDI could also be recompiled for the PPC...

Hi!

Ronald Andersson <dlanor@oden.se> wrote:
> I have a feeling that both sides refer to 'standards' that have very little
> to do with what Atari defined, but be that as it may. Life has to go on
> after Atari Corp anyway.

So, you consider the AES 4.x docs from Atari to have very little to do with Atari defined. Interesting ...

The docs clearly state that the enhanced shel_write() parameter block may contain a "Psetlimit() value" (1). I guess I'm not wrong to assume this means the value given there is directly passed to Psetlimit(), especially because there's no note on special values that would be handled differently. Reading the manual page to Psetlimit() reveals that the value "0" means "no limit", and that's exactly the behaviour you get with AES 4.x, N.AES, MagiC, and Geneva + MiNT. Only Geneva without MiNT fails here.

The next version of Thing will have a workaround, i.e. it won't set the "enable Psetlimit()"-bit in the call to shel_write() when the limit is zero. This wouldn't have been necessary if Geneva without MiNT would get it right.

Note that I simply forgot about this issue, that's why I said Thing would work flawlessly with Geneva. But it's a bug in Geneva, not a problem of not using "special shel_write() parameters necessary for Geneva".

Ciao

Thomas

(1) The docs don't state which of the three possible Psetlimit() modes this refers to, but it's at least quite sure it does not mean the CPU limit, but one of the two memory limits, as otherwise the desktop found in AES 4.1 wouldn't have the option to limit the memory for installed applications.

No, it's because it's wrong.

>The special access requirements for the Falcon's 24bit address map
>is not something that the PPc was designed to handle. There will

Why would the address bus be a problem?
I can assure you that there are many PPCs around with less than
16 Mbyte addressable RAM.
The 24->32 bit extension of the hardware addresses can easily be
handled by an MMU.

The 16 bit bus and eight bit hardware registers may well be a problem,
though.

>That sort of situation can be very unstable nowdays. If no

According to other posts here, Apple's emulator seems to do about
four times better than that on a 300MHz 603e...
(10-15 times a 32MHz '030)

How about letting an unimplemented '030 opcode be handled as a
jump into PPC code? Really simple to do and it will give you even
finer grained control.

A PPC program that wants to call 68k TOS could easily go via a
'glue' routine that does the call under 68k emulation.

>>could lead to a number of much faster programs designed for

Not any of the commercial stuff, perhaps, but that wouldn't
bother me much.

>Just developing/porting the tools needed for that would take
>years. (Compilers, assemblers, debuggers, etc.)

Just do a PPC cross-compiler of GCC and you'll have C, C++,
Fortran and Ada. ;-)

Debuggers may be a bit of a problem, though.

> is currently accessing.

If the bus is not available, another chip that wants access will
indeed be stopped. There's nothing that stops that chip from running
along in its caches, though and it seems likely that the local RAM on
the Tempest can be accessed without touching the expansion port.

>2: There is no way that existing system software can survive

> lead to total chaos in the use of system variables and
> stacks etc.

So, don't allow both to do system calls at once.

>3: It would also lead to partly parallel address spaces, making
> all pointers from ST-RAM to FastRAM ambiguous.

Hmm. I don't think I follow you there.
Why would the address mapping ever need to be changed (assuming
no virtual memory). The '030 would very likely not be able to
do anything with the Tempest memory.

>I could go on but why bother ? Meaningful parallel processing
>requires an operating system designed for that, which TOS isn't.

It's very easy to think of parallel processing jobs that don't
require any OS support at all:
- compilation (from a non-system RAM disk)
- image processing/rendering
- HTML formatting

>Remember, we are not talking of all potential Tempest users here,
>but only of such users that also have a suitable other accelerator.

But everyone will have their old '030 too.
Not that it would be terribly useful to run that in parallel with
the much faster PPC, though.

>Finally, I believe that the overall system would gain *more* speed
>by working for optimized integration of the PPc with the Falcon, and
>that requires skipping any extra accelerators as they would only
>worsen the 'bottleneck' effect of the interface between Tempest and
>Falcon.

I'm pretty sure all accelerator boards just supply the original
expansion port, without any extra hardware involved.

>Talk is easy, but development requires suitable tools.
>We have no such tools today for producing native PPc code.
>They do exist on other platforms, but not with support for
>TOS and GEM. Just porting libs would be a *major* project.

The MiNT libs etc are mostly C code.

>the TT has full 32 bit busses for both address and data, and
>the internal speed of a TT is therefore near four times that
>of a normal Falcon.

The busses are indeed 32 bit but, IIRC, only the actual processor
on the TT is 32 MHz. The rest of the system is 16 MHz.
I've certainly never seen a TT come close to four times the speed
of the Falcon on anything.

>I certainly hope I misunderstood what you meant above.

You understood me perfectly.
The driver will indeed modify the original data. The alternative would
have been to calculate some kind of hash (just using the address
wouldn't be enough), which would very likely be too slow (and/or not
very reliable).

The only ways this could cause problems are if the application needs to
access the first to words for some reason or if the image is modified
without disturbing those two words.
For icon sized images I really don't think this is likely, but for general
images it might happen. If it does, just turn off the feature and live
with the slowdown.
(It would be possible to make this selectable per virtual workstation.)

>As I see it that sort of thing can only be done by newly defined functions
>specific to that particular driver, not in any generic GEM drivers, as the
>modification of source data is a new behaviour that never existed in any
>traditional GEM drivers.

Well, it's somewhat similar to writebehind disk caches. If you turn off
your computer directly after the return from a Fwrite you could in that
case loose data, which couldn't happen with the original OS
implementation.

I agree that there should be a new VDI function to do cached blits, but
there's little chance that many programs would use it and this way many
people can get most of the benefits where they are most important.
If there is a problem with one of your applications, turn the feature
off and let me know about it. Perhaps I can devise a workaround.

>Modern desktops (eg: Thing, Jinnee, etc) are capable of handling icons
>with freely mixed sizes. Even the normal 'NewDesk' of Atari can display
>icons of any size, though it assumes that all active icons use the same

>size as object #1 in the icon 'form' does.

Ah!

It would of course be very simple to change the caching behaviour of
the RageII driver to deal with icons of other sizes. Wider icons would
be slightly more difficult than different heights, but still not very hard.
I may do something about this at some point.

>On my homepage you can find an extreme case of 'micro' icons intended for
>use with the normal Atari 'NewDesk'. These icons are only 1 pixel high,

Icons that small would hardly be worth caching, anyway.

>>If not, it could of course be very helpful to redirect it.
>
>Actually I doubt that. I think it is initialized to point to TT-RAM if
>any is present, but other Alt-RAM is not recognized at bootup, so then

That shouldn't matter since the programs in the AUTO folder are all run
before the AES starts and I'd assume a Maddalt program would run there.

The buffer definitely ends up in FastRAM on an AB040.

>>Also, since allocation of such memory would have to be done via a VDI
>>call, I don't see why there should be any need for rules of any kind.

I thought you were talking about rules for how applications could
access the memory themselves.

>RAM whenever they don't really need it, to give other APPs a chance to
>improve their performance by using it. This can't be enforced at driver
>level, since the needs vary for different APPs, so it will have to be

It could probably be handled by some kind of caching scheme.

>enforced through a set of programming rules.

I wouldn't call that rules. Perhaps guide-lines is a better word.
Anyway, it isn't as if it's likely that a whole lot of applications are
ever going to use these features. ;-)

>>I don't know how other graphics hardware does it, but in the case of
>>the mach64 kernel, you don't even have to blit into a temporary buffer.
>>The mach64 will do the expansion on the fly.
>
>That is bound to be less efficient, since it means repetitive CPU code
>for writing the data to each plane. The method I spoke of means that

I don't think you understood what I wrote above.
I only write monochrome data once to a register called the 'host port'.
The mach64 engine is set up to take everything it finds there and blit
the corresponding pixels in whatever graphics mode I've set.
That is, as soon as the first word is written, the mach64 starts
plotting 16 bit pixels (with fore and background colours according to
the 1's and 0's (if it was a 'replace mode' blit)). Since the Falcon
bus is so slow, the mach64 will usually be finished with the last set
of pixels before the processor gets around to writing a new word
(there's a FIFO queue in case the processor is faster).

>the CPU only makes one simple block move of the monoplane data and then
>tells the graphics processor to expand it. That must be better !?!

With the monoexpand scheme I was describing, the blit is already
finished when the monochrome data has been transferred. No final blit
is necessary. _That_ must be better. ;-)

>Well, I'm not so familiar with fVDI internals, or NVDI internals either,
>but I assume that both support loadable drivers that allow omptimization
>of such things to be added by third-party programmers. If so, it should

Yes.

>only be a matter of getting the necessary programming docs out to those
>programmers that are familiar with the graphics cards needing support.

Of course. Only such documentation has never been available to the
public when it comes to NVDI. I have asked for it myself.

>After all, the 680x0 series is also descended from early 8 bit CPUs.

Perhaps in some minor ways, but there isn't much in common between the
68xx and 680x0 processors.

Message-ID: <199905312035.a50599@su2.maus.de>
Source record: 77883

Hi Stephen,

SM>This is probably a stupid question but does TOS 1.2 run in high res?.
yes, of course.

SM>I thought that when I first got it I ran it in high res on a TV but I
SM>have tried it on both my Phillips CM8833 colour monitor in both colour
SM>and psudo mono (greeen screen) modes
I'm pretty sure that no ST/e will show ST-High resolution (640*400) on
any TV screen. As I know (maybe I'm wrong) the ST provides a 'mono
detect' signal at the monitor jack, which isn't recognized by TV
cable...

SM>and my current TV set (Hitachi) and on neither of these am I allowed
SM>to select the high res option.
I think that's quite normal. And on a high res monitor (Atari) you
won't be able to switch to medium or low resolutions...

Sorry

Peter

----- snip ----- re: Thing problems, launching APPs under Geneva
>
>I understand the conflict stems from the method Thing and Geneva use to
>restrict memory for older, RAM-hogging applications.

That could explain it of course, as everything will fail if there is no
memory for it.

>(As I recall, if no memory limit is necessary [i.e. if it is a modern program],
>Thing instructs Geneva to reserve 0K for the program.)

How?

Normal TOS does not contain any way to limit the RAM a program should own
on startup, so they are always launched as owners of the entire TPA. AFAIK
neither MiNT nor MagiC have defined any functional method for this either,
except that MagiC will interpret some extra bytes at the end of a program
file as being a RAM size limit but that is not involved with Thing's method.

So no real standard for how to do this exists. If Geneva has a method for it,
then that method is Geneva-specific and Thing should then use it correctly
or not at all. The latter is of course most logical anyway, for programs
that do not have any set limit.

>I believe there is a patch available for Thing to bypass this feature.

Where ?

----- some tests later -----

I have tried setting the memory limit of APPs to 99999KB, and the APPs
for which this is done do work normally, but no program whatever can
be run without first installing it in the 'applications' menu. The
"Default" entry does not allow that setting to be edited, because the
corresponding line in THING.INF does not have any field for a memory
limit.

This would force me to install several thousand programs in this way
and I would have to continue doing it for each new prgram I get or make.
That is totally ridiculous, so I won't do it.

I definitely want that patch, so I hope you can tell me where to find it.

>Geneva 6 the difference in speed with or without Mint is almost gone.
>Perfectly usable even on a 8 MHz ST.

Kenneth, I was speaking of the slowdown of using MiNT at all, even without any special AES like Geneva. MiNT itself is too slow. And when any extra AES is loaded 'on top' of MiNT it does slow down even more, even Geneva 6 does this, though not as much as version 5 did.

Just 'usable' doesn't make the grade. Not when another multitasker is capable of accelerating the system to be faster than original TOS.

But there are some cases where I find it convenient to use Geneva, to get a multitasking AES while still having a singletasking GEMDOS, as this will allow many test utilities to work that do not work properly either under MiNT or under MagiC (eg: my favourite debugger AMON from DevPac).

Also, for systems with little RAM, Geneva without MiNT is the 'cheapest' (in terms of RAM cost) way of getting any multitasking APPs to work, and many of them do work very well, even with a singletasking GEMDOS.

But the usefulness of all this is lowered drastically if one can't also use the same desktop as usual, which for me means Thing.

>My question was 'Do you have problems with DSP in turbo mode ?'

Yes, I do, as I have described in earlier mails here my system is
generally unstable under TOS 7.x mode, but perfectly stable when I
use TOS 4.x mode, with FastRAM activated by Maddalt.

>Because when DSP delay is removed on set-up all programs used on my computer
>works.

All programs I use do work in turbo modes here too, and I have removed DSP_IRQ
from \AUTO\, but TOS 7.x mode is not stable for me. This has nothing to do
with the DSP or DSP_IRQ. DSP_IRQ.PRG only installs a handler for the
'spurious interrupt' vector, and when all is well no such interrupts should
ever occur.

>I don't know if DSP and FPU have always same clock (32 in normal /50 in turbo),
>because I don't remember to found 0 ohms resistance between FPU clock and CT2B
>connector pin 11.

I don't care if it is the *same* clock or not. The fact is that both FPU
and DSP run at 32 MHz in compatibility mode and at 50 MHz in TOS 4.x and
TOS 7.x modes on an unmodified CT2B.

----- snip ----- re: programs that use DSP interrupts
>>
>>Hmmm, I don't have 'Quincy' (I don't even know what it is), but I do have

>>bombs (== spurious interrupt) in those modes.
>
>What is your others programs who use this interrupt ?

Various fairly old MOD players. The one I used in most tests was MGPL-110.

>>This makes it appear as if there are different ways of using DSP interrupts,
>
>Why ? Another possibility is only in DMA, but this function not exists on a

>Falcon.

That does not mean that the DSP can not be programmed to generate interrupts
for it, even if that will not lead to the effects intended by Motorola's
design plans. I'm not saying that MGPL-110 does use such methods, as I have
not disassembled it, but the fact is that neither the hardware patch nor the
software patch affect its interrupts in quite the same way as they do the
normal DSP interrupts of other programs (such as Aniplayer).

>If you have 'Motorola DSP56000/1 Digital Signal Processor User's Manual'
>look inside.

I do have it, but only as PDF files, and GhostScript is not a convenient
tool for reading documents of several hundred pages.

>>I should add that the program I tested is rather critical, as the software
>>patch does not work at all for it, regardless of the CT2B boot mode used.
>
>That's right. Centek think to put this patch in Dolmen !

That SOFTWARE patch ??? But that would be insane !!!

That would make it impossible to catch any bugs in either software or
hardware that cause real 'spurious interrupts', as they would all be
interpreted as DSP interrupts.

That will make it virtually impossible to debug new hardware ports and
their drivers for Phenix, as 'spurious interrupt' is one of the errors
to be expected in early stages of such development.

As they insist that Dolmen will only be released for Phenix, it should
not use any patch at all, but should use the real interrupt signals.
And even if they change their minds, and decide to release a Falcon
version of Dolmen, it should still not force anyone to use that patch,
as some of us have installed the hardware patch instead.

No, just as TOS does, Dolmen too should solve it by a loadable patch
in \AUTO\ so that all users can choose if they want it or not.

>>Of course I disabled the DSPpatch program when testing the hardware patch.

>Your system is frozen, I had this problem when I used only one gate in final
>stage (in normal and turbo mode). Maybe low level is bad, do you have a scope ?

You misunderstood. With SOFTWARE patch I got the frozen system, but with
the HARDWARE patch I got 24 bombs, both results in turbo mode with test
program MGPL-110. Under same conditions Aniplayer works without errors,
so this has nothing to do with the signal levels.

Also, you used 2 74LS outputs, which is *significantly* weaker than a single
74F output, which I now use. Actually I've tried three different variants of

the patch circuitry.

1: 74LS05 connected exactly as shown in the INTERDSP package.

2: 74ALS38 connected with same input and output relationships as the above,
but different interconnections of course.

3: 74F32 using an HF switch diode of germanium at its output to simulate
an open-collector gate. (germanium gives a very low voltage drop)

The last is what I use now, as it has the strongest drive capability and
the shortest gate delay (3 ns + turnon time of HF diode), but in fact
all three gave identical results in all tests.

>I have made an article for a french magazine ACC, 6 pages in french...
>sorry ! It's already very difficult for me to create a documentation in
>english in Aniplayer.

Language problems can be rough, I know, but fortunately results improve
with practice, and this process accelerates when you use the language
more. After all, english is not my native language either, so I too
have had problems with it, though that was quite some time ago.

>>and 2x40 connector, even though no connectors of those sizes exist. This
>
>It's for CT2A, look MONTAGE.IMG !

I have studied all the files very closely and have not found the designation
CT2A anywhere at all. The only ones I find say either CT2B or just CT2, and
according to the latest info from Centek they are synonymous, as the next
series will be identical to CT2B but will be sold as just CT2.

Seems to me like a Centek mixup of information here. They should have used
the CT2A designation in place of each CT2 in all the INTERDSP files.

>>means that the suggested method of connecting the patch output to one of

>
>Humm, you lost guarantee if Centek found a solder on your card...

So what ?

I prefer to have a system that works right without guarantee, rather than
having a system with guarantee that does not work right. A system that

attempts to emulate interrupts in software is not acceptable to me, as
some hardware things can not be emulated at realtime speed, and the loss of
all ability to recognize real 'spurious interrupts' is also unacceptable.

>>four adjacent holes in a line pointing towards the FPU in a 45 degree angle

>>hole by measuring 0 ohms resistance between it and FPU pin 31.
>
>DSACK0 and DSACK1 are directly connected between 68030 and 68882.

Yes I know, but soldering directly on the IC socket is not good for it, and
not for the FPU either. I don't think the guarantee covers that either, by
the way, so anyone making this mod does lose the guarantee in any case.

>>Now, Didier, I was much surprised at the time that you never mentioned any

>>or even an experimental version. So which is it ?
>
>It's the same card, I'am sure.

Good. As we have discussed various PMMU patches I wanted to be sure that we
do have the same hardware. It is virtually certain that the older versions
differ in some important respects.

>About experimental version, Centek has sold a CT2A ;-))

Yes, I know, but I know very little about it, as full details are not made
available by Centek for the older versions.

Doesn't all computer generated speech sound the same?. ;-)
Point is, I found the Das Boot/C64/Amiga reference on a music website quite
some time ago. It stuck in my mind, mainly because the site had no specific
C=/Amiga/Atari affiliation.
Just assumed the info to be correct. (I know... never assume)

You're assuming that. ;-)

Having not read the documentation for Geneva-specific programming, I shant speculate as to what constitutes a "bug" and what may simply be a faulty assumption. It's sufficient to say that I did perform the patch on a demo copy of Thing 1.27 here and the fix worked as advertised.

Tom

Hei Thomas,

yup, an FTP program would do the trick. If cab-ftp can't upload (???),
then fetch aFTP from http://www.pwp.cz/atack/prodlist.htm then click the
zipfile for the Sting version.

Thomas,

on 2nd thoughts (first msg was out already), I see you're using Newsie.
It has FTP functions, hasn't it?????
I've been using Newsie for my first site uploads, that was version 0.82 or
so, but 0.94 surely can FTP...
